4090. Looking for a specific Atari bootloader

Newsgroup: comp.sys.atari.8bit
Date: 2010-08-25 01:39:09 UTC
From: "x=usr(1536)" <xequalsusr1536@example.org>
Message-ID: <i51s7t$1h4$1@adenine.netfront.net>
Source record: 1329

And hello, comp.sys.atari.8bit :)

I'm trying to find (without any success so far) an Atari disk image that contains a very specific bootloader. Here's what I remember of it:

- Graphics 0 text

- Background was vertically-scrolling rainbow colour bars

- Had music similar to what's in this video:
http://www.youtube.com/watch?v=zjD9i6Q0v0U

- Had the same flying swan as in this video:
http://www.youtube.com/watch?v=cGHwMVrlA78

Unfortunately, I can't remember which titles were on the disk that it was the loader for, so narrowing it down that way isn't really a possibility. If it helps, I would have had the disk that it was on c.1985-6 in Ireland, and probably got it via the Atari Users' Group of Ireland.

Any help appreciated - I've been trying to track it down for literally years, and the vast majority of my Atari stuff is long-gone so recovering it is not an option.

Thanks!

- x=usr(1536).

P.S.: The email address above is uncheckable, so please reply to NNTP.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

4093. PC to Atari800 connection

Newsgroup: comp.sys.atari.8bit
Date: 2010-08-26 17:41:18 UTC
From: tomcee <tomcees_pc@yahoo.com>
Message-ID: <98d859ee-8a74-4a92-8691-008dae3c77a4@i13g2000yqd.googlegroups.com>

Hello:

I would like to use one of my 'modern' Windows PCs as a file resource
for one of my Atari800s.

What is the currently recommended hardware method for doing this? I
recall reading about SIO2PC quite a while ago. Is this recommended to
work with a USB/RS232 adapter? Are more modern methods available?

Thanks in advance for your assistance,
TomC

My preferred modern method is SIO2SD. You can fit an awful lot of Atari stuff on a relatively small SD card, and then you don't have to tether it to your PC. :)

Hi, I'll assume you don't have serial ports on your current computer.

IIRC To use an original sio2pc cable some people tried it with the
$2.99 usb to serial converters off eBay and had some trouble. The good
news is converters people say they have success with converters that
were still under $20.

There is a SIO2USB cable that Steve Tucker sells. I'm not sure how
much time and effort he is able to put into Atari anymore. I'm not
sure if he has updated his software to work with Windows 7 yet. Check
his web page.

There's a new sio2pc type program out AspeQt
http://sourceforge.net/projects/aspeqt/
It is quite good with some nice features. You may want to try it out
over APE or sio2pc software.

Other alternatives you can try is buying a PCI serial card for your PC
or just get an old laptop. If you go the latter route it can be a bit
of a hassle to get stuff to the laptop. Make sure it has a network
card and/or some type of mass storage. You probably need at least
Win98 to handle things like USB thumb drives for transfers.

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

If you have somewhat developed soldering skills, the SDrive
<http://raster.infos.cz/atari/hw/sdrive/sdriveen.htm> is an alternative
even easier to build , since it lacks the LCD. The most complicated
soldering part is the SD card slot (I have only found them as SMT, not
as hole-through), but this one can be replaced with an edge connector
with .10" spacing as shown here: <http://uanr.com/sdfloppy/>. If you
build a case around the drive, noone will notice the difference.

I wish someone would offer the bare PCB.

Thinking more about this... I wonder if it wouldn't be easier to base an Atari SD adapter on the 4D uDrive:

http://www.4dsystems.com.au/prod.php?id=22

I have a cart for my Tandy CoCo that uses one of these for a solid-state disk. Parts count is extremely low.

Thanks for the link. Price is about right at $30 but I think for
what's left of the users it may not get much play. By that I mean most
of the people with deep pockets have already gone with more expensive
options so there would be resistance to moving to another hack.

We have kind of designed ourselves into a corner. It started with
Atari using bits of the 6520 for memory banking which was pretty short
sighted but became the standard anyway. Specifically they should have
added a couple of logic chips like the 74LS374 for $.40 and allowed
for 256 16k banks. They had the design for their banked switched carts
but didn't use it in the 130XE. I think some of Steve Tucker's carts
and devices use that scheme.

Current use of the 6520 for bank switching is lame on several levels.
Most important is the 6520 is an I/O chip and it is just being used as
an output latch for bank selection. What would probably make more
sense is a bit banging interface directly to an SD card using the
6520. I think the last SD card I bought was 512meg for a couple of
bucks and I routinely see them on sale. IIRC you would need to do
voltage regulation to 3.3V but cost for all parts including the SD
card would probably be less then $10.

4107. Concerning Kjmann's Atari Sales & Services

Newsgroup: comp.sys.atari.8bit
Date: 2010-09-09 17:14:17 UTC
From: DB
Message-ID: <3b5i86doenl2e9g0fe6cs65mce0biujhse@4ax.com>
Source record: 1346

On 28 May of this year here in this newsgroup a message was posted to look at the new website for "Kjmann's Atari Sales & Services". At that time I was impressed with an 800XL system offer he made: an 800XL with power supply and modded to support SVGA graphics along with two game cartridges and all cables for $75. On 2 June I paid to Salvador Esquivel (Kjmann) a Paypal payment of $129.00 for the XL Game System and an Action cartridge.

That was four months ago. In the intervening 16 weeks I have contacted Mr. Esquivel five times. On three occasions he told me that the package would be in the mail within a few days. The fourth time he told me that the package was actually in the mail (this four weeks ago). He didn't bother to respond to the fifth message at all.

At no time has he ever bothered to mention anything at all about giving me my money back.

I am a disabled veteran currently in a wheelchair and on daily dialysis. I mention this only to say that this system was to be used during my grandchildren's past summer vacation when they came over to spend the night each week. It was to have been something unique that I could have done with them by showing them some of the classic old games I used to play.

Well, okay, that ship has sailed - I only want my money returned now. At any rate, I post this message as a caveat to anyone contemplating dealing with Mr. Esquivel. I hope your luck is better than mine...

D.B.

No, and that's my own fault. I guess I am just too trusting in my
fellow Atarian. He strung me along and I played into it. I am still
not convinced he is an outright thief although it is beginining to
look that way. I was just wondering if anyone here had done any
successful business with this guy?

I purchased an Action! cart from him several months ago. It was shipped
promptly. I'm disappointed to hear about your problem.

Well, like I said, the guy never seemed to me to be a thief or
con-man. The problem is that the money I sent him was hard to come by
on my particular budget and I won't be able to get that kind of money
together again to buy a different and reliable 800XL system until
after the winter fuel bills are over next spring sometime.

I understand that poop happens to even the best of businesses. But I
havent received any explanations or any of the money that should be
legitimately refunded to me.

Kjmann - I know you are reading this. What about it?

You could do a money request by PayPal and see if he returns the money? If he's a decent guy, he would try that.

Noted, thanks.

I can't remember removing an entry before because someone turned out to be
a pure crook, but I wouldn't want to list someone widely regarded as one.
I'm still hoping there's eventually some acceptable explanation for your
unfortunate experience..

A listing in the vendors list shouldn't be taken as an endorsement anyway,
I've certainly not personally done business with everyone listed. Maybe
I'll add an explicit disclaimer to that effect.

That's smart. I wouldn't want to see anyone blacklisted
from a single occurrence. I do agree that a good, simple,
and informative response would alleviate the problem for
the meantime, and it is possible that DB has berated the
guy on the first request for info, but to come into this
public forum to do so is totally wrong. A simple request
to the group for others who may have had issue with him
would not be out of line, but what DB did was just rude.

Does anyone know if there is an 8-bit Atari emulator that will run
under Windows 7 and that will support the APAC (80x192, 256 colors),or
"HARD Interlacing Picture (160x192, 30 shades of gray) modes?

4119. Sweet16

Steve Wozniak created the "Sweet 16" library for the Apple II. If I remember correctly, it was 6502 code that simulated a 16-bit CPU. The code is in the public domain.

Has anyone ported this to the 8-bit Atari?

WHAT!?! Did you bother to read my original message at all? I sent the guy FIVE e-mails over a three month period to get informatiion about the merchandise or a refund. Kjmann responded the first THREE times that it would be in the mail a few days followng each message. The fourth time I wrote him, he responded by telling me that the the package was actually IN THE MAIL! That was well over a month ago. The fifth time (last week) he completely ignored me. So I contacted the guy FIVE times before I came here because it was here that I first saw his advertisement back in June!

Coming here was a last resort in hopes that Kjman would finally take some responsiblility for his business promise. I'm still hoping he will. I'm sorry if I have offended your sensitivities, but tell us this - what you think keeping $129 after three months without sending promised merchandise is?

D.B.

I appreciate the info about the transaction and subsequent results.
It isn't rude at all, BD is doing a service as well as making an
effort for Mr. KJmann to give him his money back.
The current KJmann site has almost all hardware 'unavailable', so
apparently he is out of stock.
I found KJmann to be a jerk when he complained about AtariAge posts, I
presume he got some flak
for posting commercials.

KJmann, if you are listening. Please give DB his money back so we can
stop hearing from him. Thank you. Concerned now myself. How's that, DB?

>I have no problem with you mentioning emails to/from him, but show sources.

Oh, brother. Why would I make such a story up? If I didn't have the
e-mails I referred to, I myself would be liable for a charge of
defamation or libel. Why are you so determined to make me the bad guy
here?

>KJmann, if you are listening. Please give DB his money back so we can
>stop hearing from him. Thank you. Concerned now myself. How's that, DB?

Well, I will agree with you on one thing - there IS at one very rude
person with a pretty snotty attitude "contributiing" to this thread,
only it isn't me...

DB

The reasons for the implementation were gone by the time Atari hit its stride. Brief history according to Cortese i.e. only approximately correct and full of personal opinion.

Once upon a time there was the RCA1802 microprocessor. It was popular for several reasons like low cost and ease of getting a working system. The best thing about it was its instruction set. It took a lot of ticks to execute an instruction but they performed commonly used series of instructions on other processors in a single instruction. The processor had sixteen 16 bit registers which could be uses as anything from the program counter to an index register. For the record it was considered an 8 bit processor since the accumulator was only 8 bits. You had to load the 16 bit registers with a high and a low byte. Operations on the 16 bit registers were 16 bits in that if you decremented the lower 8 bits it could do a borrow from the upper 8 bits automatically.

You may remember a number of years ago John Harris and I made some posts about the relative merits of instruction sets. I *think* he was talking about the 65C816 with its improved instruction set and reduced code space required to do things. He gave an example of memory move that was maybe 40 bytes and I gave the equivalent code for an 1802 which was in the ~20s.

Now flashback to 1978. A big EPROM was 2k. I'm not talking about what would go into a $1,600 Atari or $3,400 Apple but something a ham & egger hacker could afford to put into his homebrew. You have to remember that even 8k *expensive* carts like the Atari ASM/ED came with two 4k eproms in the cart vs. an 8k eprom.

Now there was this early genius of programming called Tom Pittman who wrote a 'Tiny BASIC' that got most of our homebrew computers up and running with a high level language on the cheap. He was able to fit the 1802 version in a single 2k eprom but the 6502 took over 3k to do the same thing. I mention this because back then there were still the processor wars going on and the ability to do things with a single 2k eprom vs. having to buy two or a 4k eprom was good ammo.

So Woz who was a Homebrew Computer Club guy was obviosly aware of alternate processors and the controversy at the time. Being another genius of programming himself and probably having some extra space in the Apple put out Sweet 16. What Sweet 16 actually is a processor emulator tightly based on the 1802.

Now it was a nice<sweet> gesture of him to include the code. That being said nice doesn't mean useful.

The emulator uses something like 800 bytes that can reduce your code by say 40%. If your original program was 1800 bytes of 6502 it doesn't make sense to rewrite it in Sweet 16 which will use 800 for the emulator and the new code will still take up 1080 bytes! Of course if you just want to do something like replace the international character set with it you can actually reduce your code space.

Butt ugly slow. Thing is emulating a 16 bit register on an 8 bit processor is a dog. Something like 1/5th to 1/10th the speed of 6502 native code.

Time took away the need to cram code into tiny eproms and ram. Heck, a 1 megabit cart would be the way to go nowadays. Maybe doing something like a rewrite of a 1050 eprom would free up 1000 bytes in a 4k eprom but I just don't see that as a something people would spend their time on.

Funny thing is I just built an 1802 system this summer on a breadboard.

It's actually an interesting topic but more about what instructions should be in a processor instruction set. For instance if you have an instruction in the microcode that stores via a pointer register and automatically decrements the pointer register all memory moves are tight and fast. The pointer register should be as wide as the addressable memory and there should be at least two of them. Also makes things like a C compiler using pointers for everything from variables to memory moves almost trivial.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

7800 Expansion Module
=================

Plug-in Enhancement/Expansion unit for all NTSC/PAL/SECAM Atari 7800
Video Game console systems.

Adds the following:

•Built in High Score keeping capability (compatible with approx 20
existing titles and any HSC coded games/programs in the future)
•128K of Program Available Memory
•POKEY audio/interfacing IC Chip for enhanced audio/voice synthesis
and I/O Interfacing capabilities.
•2nd Audio Processor for higher end Arcade sound effects and music
•SIO (Serial I/O) Port for potential future use of Atari 8bit computer
peripherals such as Disk Drives, Printers and Modems.
•15 PIN Port for potential future use with a detachable computer
keyboard.
•Will come professionally boxed in original Silver styled "Atari XL"
type box with extensive User Guide and Technical Data manuals.
Cartridge Port ontop to allow all 2600/7800 cartridges to plug onto
the unit to play games/programs.

Please DB,

look at this from his point of View!He's not going to get rich selling Atari! Atari Dealers are a vanishing breed! Heed my Advice!If you keep attacking him publicly in the NewsGroups, you'll hurt him, maybe put him out of Business! How will this help you? You'll need his Business to prosper so he can pay you Back!It would be better to forgive his debt, do unto others as you would have them do unto you! Unload your Burden! You'll feel much Better! Thanx! =-Ben-=

snip BS from BS.
I'm sorry to hear about KJmann's theft of BD's money.
He's a thief, plain and simple. I have no sympathy toward him. BS is
a reason why csa8 has very few
posts. His spam turns off just about everybody. You come to csa8 and
see eight spam from BS
and no new posts. BS has single handedly trashed this newsgroup.

>... You'll need his Business to prosper so he can pay you
>Back!

I gotta admit, this is the most novel and convoluted justification for stealing I've ever heard of. Tell you what BS - keep the next $129 for orders you receive but don't send the people the merchandise they ordered. You can bet we will be reading about you in here then...

>It would be better to forgive his debt, do unto others as you would have
>them do unto you! Unload your Burden! You'll feel much Better! Thanx! =-Ben-=

How come this just works for me? Why don't you say the same things to the guy that took the money? Why doesn't he "unload his burden"? Why don't you advise him to "do unto others" I DID "do unto others" - I sent him the money. Now, it's his turn to "do unto me" by sending me the merchandise.

Man, I'm really confused how it is that I send a merchant that I found in this very group what for me is a LOT of money in good faith who then stiffs me, and I in turn become the bad guy!

But there's something else you might consider. Instead of defending and justifying bad merchants against the Atari community, you should be supporting the Atari community by helping to make sure that bad merchants don't drive people away.

I'll tell you what though. From now on I will only shop for Atari stuff on eBay. Their prices might be high and their selection limited, but at least they have a shopper protection program. And that should make an on-line merchant like you think twice about supporting theft as a legitimate business practice...

Dave B.

<snip>

As you said, "ship has sailed" but were you still interested in things
Atari 8 bit? I may have an extra beater system floating<literally>
around here somewhere I could give you. Beater => no RF shield and far
from pristine. I could toss in an SIO2PC cable *IF* you have a PC with
a serial port, kind of useless if you don't. ATM I don't have a
joystick but they could probably be had local to you for less then it
would cost to ship anyway. I'm not as anti emulator as I used to be
but nothing beats real hardware.

Yeah, occassionally you get burned. I bought a 65816 system and the
seller flaked on me. Freaking knocked the wind out of me for a while.
Operant Conditioning kind of thing. This is the only place I come for
abuse now, I don't even hang out on web forums anymore because of all
the hankie fights.

BTW: I think the system he was selling was S-video vs. SVGA, not quite
the same thing. There is a SVGA mod but it reflects the current
prototyping climate and prices. It's not uncommon for printed circuit
board manufacturers to charge $50 per board now and that is ~3"X5"
size. Anything significant you buy new now will probably be >$80. I
think the only exception is the SIO2PC USB cable.

Rick

_I_ don't... because I have his posts in my Usenet reader's killfile. ;)

No offense Ben... I'm just not in the market to buy Atari stuff very
often, and I did feel that the posts were too frequent. I _am_ glad
for the fact that you (and BEST and B&C and kjmann) out there though!
I know where to find all of you when I do need something. :)

I also appreciate that you helped me out with my first Atari Party
by lending me some hardware!

Hello. No I'm not dead yet. just some more complications concerning my health issues.

Thanks to Bill for alerting me to this discussion.

As for Dave B. I have no problem with his being pissed. I would be if I were in his position.

Thanks for standing up for me Ben (BSC) but there is no Excuse to just take someones money and that has never been my intention.

I did finally get back the first system I sent him. I was waiting for this because God knows there are people out there who just want freebies and that would keep claiming that they didn't get it to see h9ow much they could get me to sent them. Obviously Dave is NOT one of them, though I did need to be sure after sending the second system.

I have repackaged his system and shipped Via UPS this Time instead of the US postal service. I'm not happy at all with what's been happening with the USPS service as of late. The system came back saying they were unable to deliver it. whatever the hell that means. Part of this is my own fault for not shipping using Delivery Confirmation. although, I have always found the tracking info from the USPS to be somewhat skimpy and for the most part a joke.

Dave I have a tracking number for you from UPS I'm thinking I should just start shipping everything Via UPS. but, that means that smaller

packages would cost more to ship. That is my only issue.

Hope this clears some things up. Take care.

snip stuff from kjmann.

The customer wants his money back. I believe you're not only a thief,
but SURPRISE, you're a liar as well.
There's no way you sent a package USPS and didn't get it back for four
months. You stopped answering
DB's e-mails a month ago, or were you away taking care of your sick
grandmother?
I offer a stock 800XL, in fair stock condition, all keys work, etc.
and a power supply and SIO cable.
Take Rick up on the SIO2PC cable (if you have a serial port), and you
won't need a floppy drive.
DB can find lots of Atari software online and can use it with the
SIO2PC cable. He might need
to buy APE software, I'm not familiar with SIO2PC software. Also
would need a monitor cable and
monitor, although TVs come with composite and audio ports now. Like
Rick says, SVGA is not
very likely.

>I were in his position.

I'm not necesarily "pissed", but I do want a proper resolution to this
mess.

>I did finally get back the first system I sent him. I was waiting for
>this because God knows there are people out there who just want
>freebies and that would keep claiming that they didn't get it to see
>h9ow much they could get me to sent them. Obviously Dave is NOT one of
>them, though I did need to be sure after sending the second system.

I really have little to say on this score. i live in a very small town
(less than 3000) and for at least 10 years both myself and my wife
have been on a first-name basis with the Postmaster of our town who
lives and works in the small post office across the street. If these
packages were returned it means they did NOT reach this PO.

I would also just like to say that this whole mess could have been
completely avoided by a simple explanatory e-mail to me over the
course of August or September. While I realize there are health issues
of concern here, I feel very strongly that an e-mail could have been
sent during the six weeks I waited to hear from you. I am not an
unreasonable person and would have completely understood if there were
extenuating circumstances preventing you from completeing the
transaction. As it was, the last message I got was in July stating
that you were "back in charge" and had sent out the package. In point
of fact, I still haven't received any further e-mail from you - the
only thing I know is what you said just now to the group. It kind of
makes one assume that you are spinning a little "damage-control" here,
and what the group thinks is more important than what your customers
might think. Might I just suggest that if you are thinking of resuming
your mail-order operation, you might consider tweaking your business
practices a little.

However...

As far as I am concerned, if you have actually sent the system and it
actually gets here and it actually works, I will be a satisfied
customer. All I ever wanted was the computer. Now it's true that the
summer is shot and my original purpose for getting the system is now
moot, but as someone previously pointed out "that ship has sailed". So
be it. I am not one to hold grudges or to seek revenge for imagined
slights. This matter is closed - as long as I get my order.

I would like to mention here my most sincere thanks to Rick and russg for their much appreciated support and extremely kind and very generous offers of equipment. Now THIS is the Atari community I remember from my days as an 130XE owner back in the mid-80's. Over the years I have had several computers - I started with a TI-99 and moved to an Apple IIe in the early 80's moving to a 130XE in 1986. More than any other machine I enjoyed the Atari the most primarily because of the unyiellding enthusiasm for the Atari range of 8-bitters in the face of declining software and corporate support. While the Atari product was good, it was guys like Rick and russg that made it fun and meaningful. Thanks to you guys very, very much.

Now, my task when the computer comes is to convert Halo into an Atari 800XL Action! program. I'll make a fortune.

Or not...

Dave B.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Any one out there. I was in the Local scene in the 8-bit and 16
bit back in the late 80's and mid 90's. I was know as Bone or Boner.
Went to Buckskin BBS, Gateway BBS, Frog and a few others. Always happy
to hear what happened to my few Atarians.

Right. Because a 2000 year old fairy tale excuses what happened here.

TBH, I rarely come to this newsgroup any more precisely because of
BSC, the only time I ever bought anything from him (an XEP80), it
never worked anyway. These days I DIY...

I don't know Ben, it was a few years ago now - around 50 or 60 bucks I
think. I remember it was supposed to work...

I just chalked it down to experience, and decided to strike you off
the list of people I buy from - IIRC, you said it was tested before it
left, so ...

> Don't want to start a debate or flamewar here (inappropriate forum), but
> some of us do believe...

If people keep their religion to themselves we all get along, but when you use it to justify something you can expect that action to generate friction between those who do and those who don't believe in a deity. I'm generally happy to live and let live, but it's as annoying to me to see someone use an IMHO bogus religious justification for their actions, as I expect it is for you to read my retort about fairy tales. In other words, those who live in glass houses ought not throw stones...

Hey, Russg,

Your header contains the following line:

> Organization: http://groups.google.com

So maybe you can try to explain THAT away.

And then you have the gall of making a snide remark about who is trashing usenet, and who is saving it. Why don't just newgroup your own private newsgroup inside of Goodle, and see who comes and joins you.

Regards,

ESC_Beta@nullo2nullo.net

- - - -

Want to send me email?

There is no escape.

Beta@nullo2nullo is really Beta_Zero.

And .net is really spiritone.com

What is this Goodle thing? :)

Heck, not sure just what exactly you're taking exception to? I'm using
Google's newsgroup reader myself. It is my understanding that more and
more ISPs are dropping usenet/newsgroups so eventually most people
will have to read it from either a web based reader, web site echo, or
maybe their own linux box.

Subjective but I am a fan of the way things were ~15 years ago too.
There's still a couple of us trying to fight the good fight but I know
it is a lost battle. I can still remember when there was going to be
a .biz for anyone who wanted money to change hands. It was a miserable
failure for several reasons, not the least of which was people wanting
to make a buck ignored it because "nobody goes there." Now everything
is officially .com<mercial>.

In a few billion years the earth will be engulfed by the sun anyway.

Rick

4156. Atari 800 w/ loose cartridge door

Newsgroup: comp.sys.atari.8bit
Date: 2010-09-28 21:08:04 UTC
From: bill@newbreedsoftware.com
Message-ID: <4ca25934$0$1608$742ec2ed@news.sonic.net>
Source record: 1245

I inherited a fellow's Atari 8-bit collection. I was trying
out the 800 I got last night, and my son was smacking at the
keyboard a little too vigorously.

The system turned off [lesson learned: don't beat the computer].
I looked and it seems that the cartridge door is a little loose
or bent, so the little switch inside that turns the computer
on/off when you close/open the door loses its contact.

What's the best way to fix this? Or is it trivial to hack the
thing so that it always stays on. (I've seen an 800 set up to
do that. Less safe, but more convenient, esp. if you're doing
nastry tricks with the cartridge ports, I guess...?)

Thanks!

SOP at the time was leave the hood open and stick a pencil in. I'm
sure you could come up with something more elegant.

BTW: Check out what processor board you have in it. Not that you would
want to *BUT* if is a 6502B then you can substitue a 65C02.

Rick

What I did was install a switch, one more of many on my 800 for the Lid
Switch, real easy to do.

I did exactly that, wired the door switch closed inside the computer,
so the cart door switch didn't work.
It is pretty easy, with a little solder. Just open the computer up, I
guess there are two wires going
to the switch, disconnect the wires and tie them together. There is
no reason why the door should
turn the computer off.

Afraid I don't get what you're getting at. You don't like google
groups? I've heard of people killfiling any
post from Google Groups, maybe you should do that. I come to csa8
today and there are three
BS spam posts as usual. I've seen a number of comments about csa8 in
here and in other places
that people no longer read csa8 because of Ben Smith's constant,
frequent, multiple advertizements.
I don't killfile them, I want to know what is going on in the group.
You're not the first person I've seen who has a dislike, disdain for
Google groups. I suppose you pay
a subscription to your news source, or maybe you have a feed of your
own.
I mostly like other forums. Kjmann didn't like a forum, I won't
mention it, I presume because he
couldn't advertize there, so he started his own forum at his
commercial website. Oh, well I'll
mention the forum place, atariage.com.
Regards to you.

A nice free alternative to Google Groups is www.eternal-september.org .
It doesn't carry any binaries, but they do have a real news server.

I don't understand what is wrong with google groups. I guess I do.
It's like what used to be disdain
for AOL addresses, used by the masses and not the elite.

To be fair, the problem wasn't so much with someone having an account on AOL - it was the general disregard for traditional online etiquette that a good chunk of AOL users exhibited once they were turned loose on the Internet. The AOL email address just served to act as a potential warning sign of idiocy ahead, though not all of their users were idiots.

Anyway, I'll toss my hat into the ring for news.aioe.org as a free Usenet server with posting rights. No account signup required, and they do carry a pretty good span of newsgroups. No idea if they support .binaries or not, but then I don't use NNTP for that.

>Plug-in Enhancement/Expansion unit for all NTSC/PAL/SECAM Atari 7800
>Video Game console systems.

Mega-crazy and I hope you get a successful result. But I will
respectfully lightly rain on your parade for a moment.

The high score part is cool for those who really enjoy those games,
but who really enjoys 7800 games? Among the classic systems I've owned
are the 2600, a ColecoVision, a 7800, several Atari 8bits incl. an
XEGS, and a Nintendo Gameboy. I think the 7800 was the least enjoyable
of them. Dark Caverns was tedious and Galaga felt incomplete, for
example, and Asteroids *looked* good but the play value and
faithfulness to the arcade were very poor (it was like a 2600
Asteroids enhancement, not an arcade Asteroids port).

The productivity part sounds interesting, esp. the SIO and KB ports,
But there would need to be a scary amount of development done to
actually use 8bit peripherals, and once one could, what then? The 7800
is not compatible with anything. The retro community is not tiny, but
you're planning to make a niche of niches. To get the activity going
to realize the use of these functionalities would be really
challenging and take a long time. Compounding this is that the 7800 is
reportedly difficult to program for.

Okay, I said my criticism and I hope I wasn't negative about it.

Competition for coin has never been stiffer. I've spent mine on
several Sunplus ARM based handheld systems and a Windows Mobile phone.
I've just become aware of the Dingoo system which pretty much puts
anything from ~2 years ago to shame. You can buy it for $80 and with a
$30 optional SD card it turns into a dual boot system with Linux that
seems like it runs every emulator known to man.

I've seen the Android and IMHO it seems superior to my Windows based
cell. They tie for basic functions like phone and GPS but the Android
leaves Windows behind when it comes to apps. I still haven't installed
an 8bit emulator on my cell but it is on my to do list.

I'm not sure which WM-based phone you have right now, but there are a number of projects to get Android working on WM-based hardware. They're in varying states of completeness, but generally look promising.

For an example, take a look at http://7x7.us/Uu0 - I've been running this on my HTC Rhodium/T-Mobile Touch Pro 2 for a couple of months now, and while it's not quite ready for prime-time (no Bluetooth is a killer for me), it certainly blows WM6.5 out of the water on the interface alone.

FWIW, WM7 is supposed to be pretty slick. However, in Microsoft's infinite wisdom, they'va announced that it will only support phones with three face buttons. Mine has four, so no upgrade for me.

> They tie for basic functions like phone and GPS but the Android
> leaves Windows behind when it comes to apps.

Ehh - that depends on what you want to do. All I really need from my phone apart from the ability to make calls, sync my calendar and email, and do some light web browsing is an SSH client. For everything else (and this even includes SSH), there's a laptop.

> I still haven't installed
> an 8bit emulator on my cell but it is on my to do list.

They're out there, but I'm not overly-impressed with them. To be fair, phones just aren't a great hardware platform for this kind of thing (IMHO) other than for the neat factor.

- X.

The phone hardware is probably closer to the heart of the matter.
MetroPCS Samsung Code i220 so it is only ~WM6.1 and I have heard
somehow Samsung was loving the pooch on even getting it to WM6.5.

That's part of my dilemma. For instance, took my boat up the delta to
Stockton. Two of the planned stops for gas were under repair so GPS
functions got me an open fuel dock while I was on the water. I use the
camera and MP3 player a lot too. Other thing is I was paying ~$170 for
two land line phones, dialup ISPs, and two cells. I already canceled
one phone line and as soon as I get the Code tethered via Bluetooth I
will cancel the ISPs. From what I've seen the through put on the cell
is close to double that of dialup. Yeah, I know, but I live in the
country and we don't have DSL or cable.

BUT geesus! My S.O. said something like "Look how bright that star
is!" and I replied "I don't think it is a star, I think that is
Venus." My Son loaded an app on his Android that works with the built
in GPS and sensors to identify stars and constellations! My son points

his Android on the section of sky where we were looking and a star map comes up with Venus and the other stars in that slice of sky identified.

I have Atari800 up and running now. Aside from things like small screen it seems to be a worth the effort. The Android and Dingoo for both beat my cell for number of emulators but as long as mine has the one I want, I can't complain.

This is a good point. My Rhodium's running WM6.5 just fine in comparison to WM6.1, but Android's slooooooow on it. Granted, I'm running Froyo (Android 2.2) off of the SD card as there's currently no way to install it to ROM on that phone; my guess is that a 'real' install would improve things quite a bit in that regard. At least, I certainly hope this is the case, since I like the phone from a physical interactivity standpoint; I just can't stand the OS and really want something better.

FWIW, WM6.5 isn't a huge leap over WM6.1. It's definitely better in several ways, but don't expect a quantum leap if/when MetroPCS makes it available for your phone.

Understood on the above, and no arguments there. I long for the day when we have one device to lug around that not just does it all, but does it all *well*. Frankly, I don't see any of the smartphones (no matter how good the hardware or OS may be) falling into that category yet. It's coming, but it's going to be at least another 3-5 years before we really see it come together IMHO.

Allow me to make a suggestion re: GPS: Garmin GPSMap 60CSx and the Marine mapset. Sensitivity and selectivity on that unit typically outdoes every GPS-capable phone on the market, and the ability to stick in a 4GB (or larger) micro SD card and load all of your maps onto it is killer. I've had mine for about 4 years now and love it.

> My son points

Now *that* is cool. What's that app called? I'd like to do some
reading up on it.

> I have Atari800 up and running now. Aside from things like small
> screen it seems to be a worth the effort.

This was my main gripe with it, and I don't fault the emulator for the
phone's screen being small. It just limits the amount of interaction I
want to actually have with it, though, so while it's cool to have it's
kind of limited as to how much use I could get out of it.

There were three or four responses to this post, I don't see them
now. A couple suggested some
free usenet servers.
Where did the posts go?

Hi, Jack.

There are a few utilities floating around for this. My favorite is atrwcx,
which is a plug-in for Windows "Total Commander" (A Norton Commander clone).

Seems to be MIA on the net, but drop me a private e-mail and I'll send you the
copy I have. Instructions are in Polish, but it's installation and use is
easy to figure out.

Thank you for this tip! I had been using google groups but I didn't like its subscription option (only a digest of messages, not individual email messages). Using aioe has enabled me to use Thunderbird to receive each message individually again. Thank you!

Glad it helped - I'm not a fan of Google Groups either, but there are so
few free Usenet servers out there anymore that they've become the de
facto default option for most people.

FWIW, I see from your headers that you're still using Thunderbird 2.
You may want to stick with it for NNTP - TB3 is an improvement as a mail
client over TB2 IMHO, but for Usenet it's a little weaker. And it
really sucks as an RSS reader.

Certainly that's a better solution for reading and writing full-disk images,
but I'm not aware it has the ability for file-level access. Am I overlooking
this feature?

Google Sky. Any description probably won't do it justice. I grew up
with Gilbert telescopes and still own a small tripod mounted
refractor. This was the neatest thing I've seen in years.

Two old one's that I remember are ~UTIL by Charles Marslet(sp?) & ~SR
or Sparta Read by Oscar Fowler. I seem to recall they had some
limitations like they could only work with double density disks. They
should both be at the UMich atari archive.

Preston Crow had some luck with ANADISK which could read anything *IF*
you had the right floppy controller. You needed to flip bits after
reading & he wrote the program DEANA to do that. ANADISK was pulled
from distribution by the owners as they do data retrieval as a
business.

Right, but the OP was asking for a means of transferring files in and out of
the diskette (or image file).

He said MS DOS but didn't specify density or image file, just formatted disk.

Otherwise I would have suggested using an emulator. For that matter I think the original Xformer was MS DOS and it had some limited function for manipulating disk images. Something like an H: or F: device that mirrors the PC hard drive.

umich does have some anyway including another by Marslett called ataridsk. Odd enough, it has anadisk too. Not that it is a must have but it has been withdrawn from public distribution. If anyone has some old software they want to pull off disks going back to CP/M you may want to take a look at it. I seem to recall it is read only.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/

BTW: There is an old copy of a transfer program I wrote there but the .exe is broken. It would work on an unmodified 1050 but only transfers one file at a time. I used Turbo C 1.5 to compile it and it had a non standard call to do sector based R/W on the IBM side. I'm not sure if the call is in later versions and I didn't keep a working copy for myself.

Yeah, eternal-september's good as well, and I use them for fill-in on a
couple of groups that news.aioe.org doesn't carry. aioe gets my vote
for not requiring an account to use their servers, but either one's a
good choice.

Hiasoft here:
http://www.horus.com/~hias/atari/

has utilities to read/write MyDOS double density files with MSDOS in the PC
5.25 floppy drive; uncertain re: Sparta media capability.

PC XFormer could read from Atari drives with a special cable thru the PC
parallel port; IIRC it required an old Pentium 100 or slower for the timing
to
sync up.

Posting-Frequency: 10 days
Last-modified: April 26, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Anybody know where I could get a couple 4464 64x4 dram chips?
They can be used to do the Craig Lisowski 600XL memory upgrade to 64K.
Rick?

I have a couple in SIP vs. DIP if you want to try using them. I was
sure I had some DIPs too but I can't find them. I'll keep looking
because I remember having an old ISA VGA card that used them.

I think the SIPs are 19 pin devices. I don't have a datasheet for them
so I'll assume they have the same signals as a DIP chip.

Rick

I also had some (44164s) on an old ISA video card. I gave the card
to someone who was better at desoldering than I.

Now he and another Atarian both have upgraded 600XLs

p.s. The old video card was a Paradise VGA card (circa 1987).

Thanks Rick, Steve, Bill. I don't know what a SIP vs. DIP is. Sounds
like single inline vs. double inline,
but I'm sure that's not it.
I'll probably order from jameco what Bill found.
Thanks a lot.

I checked that, Russ. It is a utility for combining several small boot
applications
onto a single boot disk with a menu; just efficient use of disk space on the
ATR.

I think he needs the ATR8000 boot CP/M OS or possibly instructions for the
arcane command line procedures to dupdsk it. I got my ATR used and it did
not include any of the CP/M materials.

I don't believe this is what looking for. I found a file called
CPM.ATR. It has a file called
ATARICPM.COM

Accidently hit 'Send'. The .ATR I found has an Atari executable
called ATARICPM.COM and
a couple Turbo BASIC utilities. The ATARICPM.COM boots to a menu
screen to copy
and directory drives. Its title is 'Atari CP/M Help/Copy Program.
And the DOS 2.75 .ATR
has utilities called:
ASCIICON.TUR
CPMTOSTA.TUR
STATOCPM.TUR
IBMREAD.COM
UMONXL.COM
TURBOBASXL.COM
(c) 1987 Lutz Ristau
It doesn't need an AT8000 to get CP/M.

Sould someone point out CP/M w/o an app that you absolutely have to run sucks?

I mean if your great grandfather wrote his will leaving you millions using Worstar on a CP/M system it could be worth your while. Likewise if you want to develop Z80 code it would be a way to get there. I have done it myself to run a few archaic programs like Hunt The Wumpus and Rogue. In general CP/M apps are written to do screen I/o via a terminal type consol so it is like doing word processing over a modem or playing a bbs door game.

Rick

Found this old '84 article on the ATR-8000 and CP/M usage:

http://www.retroarchive.org/cpm/cdrom/CPM/ATARI/ATR8000.RVW

Seems the 64K model ATR8000 was required to run CP/M; maybe mine
is the 16K model and that is why none was included. Does anyone know
how spot the difference in the 16K & 64K ATR-8000s?

We're talking about CPM.ATR. I found it on Andreas Magenheimer CD he
sent me. It is from Germany.
I'm pretty sure it was Andreas.
I can post it on AtariAge and you can download it. It didn't have any
docs except for a small one about
TurboBASIC.
Let me know you want me to post on AtariAge.

Lookie!

Star Raiders blasts off in early 2011
By Tor Thorsen, GameSpotPosted Oct 13, 2010 9:05 am PT

Episodic remake of Atari 2600 space combat sim arriving on Xbox 360,
PS3, and PC early next year; first trailer inside.

http://www.gamespot.com/news/6281815.html

Also, the press release:

Atari's Legendary Star Raiders to be Re-Imagined for a New Generation

Offering Team-Based Multiplayer for the First Time; Star Raiders to
Soar Onto Xbox 360, PS3 and Windows PC Download in Early 2011

http://www.atari.com/node/3660

And here's a Q&A with senior producer (from Atari) and the president
of Incinerator Studios (the company developing it):

Star Raiders Q&A - First Details
By Staff, GameSpotPosted Oct 13, 2010 9:03 am PT

Senior producer Jonathan Moses and Incinerator Studios president
Joel Goodman discuss this upcoming remake of the classic Atari 2600
game.

http://www.gamespot.com/xbox360/action/starraiders/news.html?sid=6281808&mode=previews

cough They keep calling it a "classic Atari 2600 games", which isn't
exactly accurate. The original Star Raiders was from 1979 for the
Atari 400 & 800 computers. (There WAS a 2600 port a few years later.)

I also emailed Doug Neubauer, who created the original Star Raiders
(and developed the POKEY chip in the Atari 8-bit series),
and he hadn't heard about the remake yet (!)

It sounds like it WILL have:

* Galactic map
* Energy management

I HOPE that it'll also have:

* "WHAT'S WRONG?" ;)

And apparently the ship will 'transform' depending on the situation.

Anyway... now I need a PS3.

Oh, and I also hope it has a weapon that sounds
like the original Star Raiders photons (like BattleSphere does),
and it sounds like (from the Q&A/interview) that it might have
the original game as a built-in. (And I hope they mean the
real original from the 400/800, and not the 2600 version! :))

99% of ATARI 800 XL/XE hardware and software was designed by men.That proves that women are too stupid to design anything for the 800 XL/XE. Women should not work with computers!

Women should stay at home and they should care for the kids and wash, clean and cook for their husbands. Men were made for designing hardware, for programming, for working and for earning money.

Feminism is evil, we HAVE TO turn back time and we have to take it back. Women MUST NOT make careers, they have to be mothers and homemakers.

Come to alt.misogyny to talk about how evil feminism has made women and what we men can do to destroy that evil and to bring back the lovely housewives of the past.

Still ... I am glad someone did ... River Raid was by a woman, right?
Excellent game I spent a lot of time playing.

How is that for stupid?

4221. MULE Game - First Colonist

Newsgroup: comp.sys.atari.8bit
Date: 2010-10-15 23:55:22 UTC
From: Eman Kcin <j70141@hotmail.com>
Message-ID: <756fcebc-34f9-45f1-956f-96268e5907dc@u10g2000yqk.googlegroups.com>

Just out of curiousity, has anyone else made it as the 1st Colonist on the Tournament level of MULE? If so, what was your strategy?

Personally, what I had to do was provide food and energy to all the colonists on a continuous basis. Before round 10 or so, they trusted me enough to depend on me 100% for all their food and energy needs. Then on round 11, I cut them off and refused to sell.

This allowed me to be the top colonists in the end, but it never gave the colony as a whole a good final ranking. If I did not withhold food and energy on the last round, the colony always had an excellent ranking, but I would not be the 1st colonist.

Does anyone believe the game cheats on the last round to make the computer players higher?

And Anne Westfall of Archon fame! Oh, the hours I've spent on that lovely game. Roberta Williams of the Kings Quest series! Dona Bailey and Centipede!

and I'm sure, many, many, more... :)

Oo-oo I know this one, M.U.L.E. by Dan (Danielle) Bunten. Check her
out on Wikipedia.

BTW if you were a true misogynist you wouldn't even put up with a woman
in the house, let alone the kitchen.

I think misogyny is natures was of removing a section of idiots from
the work, unless of course they figure out a way to self replicate :)

What I'm looking for the floppies already made up. I've seen people in
other places who have tried making the discs from images but couldn't
because the boot track is special and the discs aren't bootable unless
you know how to format the disc properly. I don't have any of the
discs that came with the ATR so I need all of them.

I have a couple of disks from a collection I acquired that claim to be CP/M 2.2 masters for the ATR8000. If anyone can elaborate on the formatting, I'd be glad to try for a copy. I have a lot of ways to go at this, including a Catweasel (which can read anything - with enough coding work).

I'm guessing they use Atari standard density (like a 90k diskette) on the boot track (or tracks?), then DD (or ED) for the data. Anyone know for sure?

Steve

Against the computer? I usually focus on food and energy first. The computer players are usually too greedy for smithore and crystite to bother about these essentials and have to buy from me. Instead of collecting soil samples, I watch their assays and memorize the plots they tested, then try to build a large area of adjacent plots in that area.

For high crystite production it is much more important to own several adjacent plots (even buy buying them) than having "high" or "medium" plots. One also must never be low on energy. Food is only important as long as one has to equip his plots with mules.

In the final phase of the game, I reduce my food plots in favour of energy and crystite (by equipping mules for crystite, leading them onto energy plots and exchanging them with the energy mule, then placing this one onto a food plot and finally leading that mule back to the store).

I win the vast majortiy of games this way.

Putting an embargo on the computer players gives bad end results, while my method may result in totals of more 80,000, on several occasions more than 100,000 credits and thus allows the players to "live comfortably" or even "retire in elegant estates".

Thorsten

Photo of the switch on the board. No wires. Soldered to the board.
Seems a shame to mangle it. Maybe I can add some solder on the bottom to
bypass the switch??? I am not a HW guy, have never put a drop of solder on
a computer, and this is the first time I've ever opened an 800... :) Thx!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I'm scared! :) I see three points on the bottom of the board
under where the cartridge door switch (shown in photo at URL below)
attaches.

Should I just solder them together? Would it be safer if I just
used tape to force the spring-loaded button down? What? :)

Bill, the switch is soldered to the board by three pins. There are
just two pins for the the switch to close.
Look at the bottom of the board under the switch and unsolder the
three solder points and pull the switch out.
Then just tie the two points together with a wire, on the top of the
board. You can see from the traces on
the bottom of the board which two points need be tied together.
I'm gonna post a picture on AtariAge.

I finally got my domain back:
http://www.atariplanet.info/ATARIBBS.TXT

And if anyone is aware of any updates to the list, they would be
appreciated.

Thanks,
Trevor

Super, thanks! I've got a friend with a multimeter and with some soldering knowledge
who offered to help, so we'll be using this photo as a reference. :)

Thanks, Bill, those 41464-10, I ordered two from Jameco, I just got
them yesterday (10/20/10) and installed the upgrade, now I have a 64K
600XL, works great.

Nice. Glad I could be of help. They usually have refurbs of odd
DRAMs that are still commonly used. I have never had a problem
with anything that I have bought from Jameco.

Bill

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Kind of funny. I've been working on some old laptops and decided to use one as a sio2pc server. I got kind of picky trying to get W95 working with all the right drivers. Teats on a bull because MSDOS or DRDOS handle 520 meg partitions & most of the hard drives I have available are less then 2 gigs. So with keen interest I start reading a post about one of the candidate laptops, a Toshiba 445, and it gets a bit savaged for having a slow(133 mHz) processor, limited memory, no longer supported, .. then I finally look at the post date 2004!

I have to admit W95 was pretty weak. I just use a flash drive to transfer files on later computers but W95 doesn't even have good USB support.

Then I start looking at my Red Hat Linux 6.2 CDROMs & I find Red Hat tanked! I really nedd to get out more!

The Original SIO2PC Software is DOS Based. Also There is Still a DOS
version of APE Available.

there is a DOS driver for flash drive that I have. it's pretty handy
but, you do have to have the flash drive plugged into the USB port
before you boot the PC up.
I also have a win98 Generic USB Flash unit driver. it works like XP
and etc. you can plug in any USB flash drive and it will automatically
use it.

I'll dig them up for you if you like.

Thanks for the offer but I'd hate to make work for someone when I'm
still confused about what I'll end up doing. Story is: A friend bought
a pallet of busted up and obsolete laptops with a bunch of hard
drives. I've found a couple with later OS then W95 but I don't know if
the laptops have the guts to run anything later i.e. only 8 megs of

ram.

What I had'a ought'a do is pick up a netbook. I've seen them for ~$300 and a cheap USB programmer off eBay. I just get to fixing stuff and end up with "deer in headlights" syndrome from too many choices. A 40 meg hd with DRDOS & maybe a 3.5" floppy would be plenty but I'm being self indulgent. The high end end will eventually make sense to me, just takes time for me to come to my senses. SHEESH! I'm even thinking I need to get one of these tired laptops running Red Hat Linux!

Rick

If you really need DOS compatibility, check out DOSBox
(http://www.dosbox.com/). The big advantage to it (other than being
multiplatform) is that it gives you backwards-compatibility on modern OSes.

Ubuntu is the popular one these days. Or just go straight for
Debian. There are also distros made specifically for smaller/slower
systems (PuppyLinux, Damn Small Linux, etc.)

Enjoy!

XF551 can detect the density in first sector of 5 inch disk normally
but XF35 rom by Bob Woolley upgraded, the drive can not detect the
density!?!?? how come? double density disk can not be read after
turning on the drive! I hate that when the single density DOS disk
boot, change the density, and the drive can read the double density
disk. I want a permanent double density after turning on the drive. Do
anyone know how to solve the problem?

I'm still a bit perplexed but I think it is getting a bit narrower. I well select one with floppy & CDROM with at least w95 capability but would prefer something later but not too new. Will all those versions of linux run on a Pentium I with 8-24 megs of mem on a 1 gig drive?

BTW: One of the old systems was from Cisco. hard drive had a gig of old internal memos and emails. God awful boring to look at. Hard to believe I used to generate that kind of crap for a living. :)

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I have a number of issues of Compute! and Creative Computing from the
1980s-90s era.

If anyone is interested in these, please drop an email to me.

Thank you,
TomC

I don't know what you're trying...? You want your xf551 to be in
double density at startup.
I wrote a program to set the density. It has been a long time, so it
may only be for the US Doubler 1050.
Usually, a double density capable drive detects the density when you
insert a disk, you're saying the
Woolley upgrade doesn't read a double density disk? What kind of
upgrade would that be?

The Wooley upgade only added the ability to use 80 tracks and maybe
spinup delay. Not sure but it may have changed a few other things like
step rate.

Problem is the XF ROM had some bugs in software and the only fix there
may be is the Puff ROM.

If you insert a disk in a 1050 you notice the drive always spins up
for a few secs. What goes on is Tandon, the actual desigers of the
1050, knew the drives would have to use both single and double density
disks so they have the 1050 fireware keep an eye on the door latch and
check density every time it is cycled. The XF being an Atari design
was not nearly as robust.

I'm not sure of all the bugs in the XF but you can read the Puff
blurbs about his improved ROM to get an idea. FWIW: I directly asked
Puff about bugs he said he discovered in the XF and SD on CIS and he
would not respond. At the time he was promoting his own business and
as such did not provide assistance to any of his competition.

As Jack notes switching disks has problems. I think you get a read
error on your first command like reading a directory and it only works
if your sofware/DOS is setup to retry. There's a few other odd bugs in
there like ~writing a sector w/o turning the motor on or some such.

Rick

I can't guarantee what'll run on what. These days I've got some
Centrino thingy with 2GB of RAM that I got from Dell (Ubuntu pre-installed).

It should certainly be easy enough to figure out what version fo
Linux is still around that'll run on a Pentium with 24MB of RAM.
(1GB is plenty of disk.)

Assuming this is for SIO2PC and other tinkering, you could even run it
without a GUI, or even headless. (SSH into it remotely from a more
modern system, and run all your commands remotely on the box.)

If SIO2PC kinda stuff is what you're after, you'll want to make sure
that the serial port'll work well, and that you can build something
like Matthias Reichl's "AtariSIO" for it. (i.e., compatible version
of the Linux kernel)

These days, I'm fully SIO2SD, so I'm kind of checked-out when it
comes to this kind of nonsense. ;)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Entries do not include an email address due to the overwhelming amount of spam that would result.

Internation Reply Coupons

The following is from: (2010.09.12)
http://www.upu.int/en/activities/international-reply-coupons/about-irc.html

About International Reply Coupons
When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country; however, if they are from different countries, the enclosed postage stamp will not be valid.

All member countries
This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. As the service began before the days of airmail, the earliest coupons could only be redeemed for a single-rate ordinary postage stamp to a foreign country. In terms of today's UPU Convention, International reply coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

Mandatory to exchange
The UPU's International Bureau processes several million coupons each year and deals with of all accounting aspects. The International Bureau does not sell IRCs directly to customers; they must buy them from their local post office. Although Posts are not obliged to sell IRCs, it is mandatory for Posts to exchange the coupons. If a Post does not sell IRCs, it is possible to purchase them in a post office located in a neighbouring country.

DISCLAIMER

Appearance in this list does not constitute a recommendation or endorsement of the business, individual, product, or service listed.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Vendor: new hardware expansion items, including: SIO2PC (internal/
external), 1050PC, Midi, Voicebox (Atari Magazin), Function keys,
16-OS-switch, AKI, RAM Expansion, Audio/Video cable and adapter, Videobox.
Special lower prices for ABBUC members.

HiassofT 11/10
c/o Matthias Reichl
Wolfgangerstr. 26
A-4820 Bad Ischl
Austria
http://www.horus.com/~hias/atari/
Developer: AtariSIO V0.30 for Linux (2004-08-31; package contains: a Linux
kernel driver; atariserver - an Atari disk drive emulator similar to SIO2PC or
APE; atarixfer - a small tool to read/write ATR images to an Atari disk drive
connected by a 1050-2-PC or ProSystem cable), Atari Tools for Win32 V0.30-
101002 (dir2atr, adir, and ataricom from AtariSIO package, compiled as a Win32
console application), AtariDsk V1.2 (read, write and format DD 180K Atari
disks on the PC), WriteAtr V0.92b (2003-07-24; write double density ATR-images
to Atari floppy disks on your PC; also create ATR-images of double density
floppy disks), MyPicoDos V4.04 (2007-08-11; small "gamedos" that can read COM,
EXE, BIN and BAS files; supports MYDOS subdirectories and large disks), MyIDE
Tool V0.30 (2007-11-11; direct access to harddrives in MyIDE format on your
Linux/Windows PC), Highspeed SIO patch for XL/XE OS and MyIDE OS V1.20 (2009-
05-24; extends the SIO routine of the OS to support: Ultra speed (Happy 1050,
Speedy, SIO2PC, ...), 1050 Turbo, XF551, and Warp speed (Happy 810)), 512k
SRAM extension for Atari XL/XE V1.2 (2009-09-28), Turbo Freezer XL/XE 2005

Repair Shop. Most Atari 8-bits, especially 1050 and 800XL

Michal Pasiecznik / "Pasiu" 1/08
Poland
http://hardware.atari8.info/ and http://pasiu.krap.pl/
Developer: 576 kB - 1 MB RAM expansions (based on the Amiga 500 and Amiga
600 RAM expansion modules), 1 MB - 2 MB SIMM Expansion, ROM Changer,
AutoStereo, XF551 LED Track Display, intSDX (an internal SpartaDOS X
upgrade), ARC (Atari Real Clock - an alternative realtime clock), IDEa
Interface (100% compatible with the KMK/JZ IDE interface), Simple 65c816
Processor Adapter, Warp4 (4 MHz 65c816 accelerator card), Warp4 MegaMEMboard
(1 MB of linear RAM for Warp4), Project F7 (16 MHz 65c816 accelerator card).
Software: CD Audio Player 0.9 for KMK/JZ IDE and IDEa Interface.

Pecus and Pirx 6/07
Poland
http://www.future-net.pl/~10vg3b/scorch/
Developers: OMC65 crossassembler - Our 5oft MaCro assember for 6502
ver. 1.3 (Win32 executable); Scorched Earth for Atari XL/XE build 114,
Chip 8 & SuperChip 8 emulator v1.1

Tomasz Piorek / electron 7/07
See also: Taquart
Poland
http://vbxe.atari8.info/
Developer: VBXE - Video Board XE - project is a programmable, FPGA based
graphics subsystem for Atari XE computers

Radek Sterba (Raster/C.P.U.) 5/09
See also: C.P.U.
Czech Republic
http://raster.infos.cz/atari/ or http://raster.atari.org/
Developer:
Games: Zahada, Volleyball, Predator, Posthelper, Videopoly, Dangerous Street,
Magnetit, Naturix.
Games co-developed with Roberta Knilla/FUCO/Funny Computer: Android, Cityhawk,
Imagine, Gunhead.
MPE (MIDI Pattern Editor) v2.3.
utilities: HiLoader4.2, CompressCopy4Hi, TurboToDisk3, RSTos3.1, RSTos3.7,
FROMT, DIRCOPY4.
More games: Head On, Speed Up!, Speed Up!! Gold Edition.
demos: YamahaDemo, Illusion 3, 80 rectangles, Motor, Search6502, Flame999,
SelfDemo, Wow1k, Fort 320, RMTdemo, Hellix, Basix, Fireworx, Forever 3000,
Plastic, Victory, Easter Night, Seawolf, Virtuoso, Fluid Chessboard,
Binary Celebration, Jozin z Bazin.
RMT1Player v1.06 (plays *.RMT (Raster Music Tracker) song files on the Atari.
Atari/PC software: ATADIM v3.05 Beta (work with XFD/ATR Atari disk images),
DRATEX 1.6 (Drop file Atari Czech text convertor), MAC2MTX (Mac65 to Text),
Raster Music Tracker (RMT) v1.28 - cross-platform tool for making Atari XE/XL
music on PC (OS Win9x), SA_POKEY (Standalone dynamic DLL library for emulation
of Atari Pokey sound chip), SA_C6502 (Standalone dynamic DLL library for
emulation of Atari 6502 processor), Creaxin1 ("Create X in 1") v1.03 (creates
ROM image or Atari executable feeder program for X programs in one S/XEGS
RAMcart 128KB).
Atari/PC hardware: LPTJOY (connect an Atari joystick to a PC), MultiJoy4/
MultiJoy8/MultiJoy 16 (use 4/8/16 joysticks on a single Atari),
SIO D-SUB15M Standard Atariklub PV.
Games for MultiJoy: Cervi, Multris, Shot'em all (SEAL), Cervi 2, Astro4 Road.

SteveR's Classic Cartridges (Steve Reed) 8/05

I'm being "inconvenienced" by my cellphone Atari emulation so I
thought I would take a shot here. Samsung Code with built in keyboard
& I can't get it to enter numeric data no matter what key combinations
I press. i.e. normal method is <Fn>E to get number 1 but emulator
stays in character mode. I can just rotate disks from the emulator but
I would rather be able to type stuff like D3: or FILE.001

Rick

Alright folks,

Well, I always thought that I had a face for radio, and now I'm going to see if I have a voice for radio too. Fledging Cheshire radio station for Crewe and Nantwich, The Cat, will tonight have a 'special' guest to talk about the 8-bit indy development scene and other 8-bit related stuffs. You can listen online by clicking http://www.thisisthecat.com/ from 21:00 onwards. You may also send some questions in regarding indy developments and/or 8-bits as long as they are not too taxing to studio<SPAM>@thisisthecat.com (you knows which bit to remove). Please avoid the "which is better, the Speccy or the C64?" sort of questions as we all know the answer to that one.

A note for younger people, words like "C*mm*d*re", "C64" and other mild swear words will be used during this broadcast, so if you don't want your mind currupted, then don't listen. You have been warned!

Regards,

Shaun.

Just stumbled across this via YouTube:

http://little-scale.blogspot.com/2008/01/nested-for-statements.html
http://little-scale.blogspot.com/2008/01/soft-midi-pokey.html

Basically, someone hooked up an Atari POKEY chip and can use it
as a MIDI device to play music.

I can point that the last paragraph was in *X-POST* between the two
comp.sys.* ? as usual....

Personally, every 8-bit machine has his strongness and weaknesses, and I
guess that it's time for starting the talks for the peace treaty closing
this thirty year flamewar :)

Best regards from Italy,
dott. Piergiorgio.

Nice attempt to flame-bait....

No attempts at anything really. As I said on the show, I like the
Commodore VIC-20 and PET a lot. In any case, some Commodore people
need to get a sense of humour.

Regards,

Shaun.

And indeed also Sinclair people....

At least we agree :)

Side note, in French and German the words PET and Vic respectively
actually sounds like local mild unrefined word.... ;)

Best regards from Italy,
dott. Piergiorgio.

Which is why they didn't call it the Vic in germany, iirc?
They called it the VC 20.

Not nearly as much as [some of] the Immortal Grandmasters of the C64,
I can assure you.

> At least we agree :)

If you say so.

> Side note, in French and German the words PET and Vic respectively
> actually sounds like local mild unrefined word.... ;)

As well as pointing out that I'm not a C64 expert or specialist or
whatever, I also dropped the bombshell within the broadcast that I
prefer the Commodore PET and VIC-20 over the C64 mostly.

> Best regards from Italy,
> dott. Piergiorgio.

Take care,

Shaun.

Well, also I prefer the PET to the Vic and 64, mainly because these was
more "balanced" engines re. Vic and 64.

OTOH, in the sinclair branch, I prefer the Speccy to the ZX81-80.

Best regards from Italy,
dott. Piergiorgio.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Body handling: HTML body converted to readable text

Kind of good news for me but it was a rough journey. I decided to use one of the laptops I am resurecting to do some disk rescue of 3.5" disks that hadn't seen fresh air for 15 years. Nicest package, relative term, is a Toshiba 4020CDT. It has a 300 mHz PII with 90 megs RAM, CDROM, USB, Serial Port, 20g HD, and a 1.44m floppy.

Bad news is I am stuck at W95 as the only copy of WXP I have won't upgrade it. Bad because USB kind of sucks on that vintage Windows but good in a way in that you can reboot W95 in DOS mode and everything DOS seems to work.

ANADISK and DEANA aren't exactly as I remembered. Looks like the combo was mostly to recover single density disks. That is ANADISK will copy a paper plate but DEANA seems to balk at anything other then single density XOR flipped bits.

Another thing that sucks about W95 is it came with IE 2.0 which makes most of the web unreadable. Tried upgrading to Firefox and it belched bad during setup. No love from Opera either. On the bright side umich.archive is so old IE 2.0 has no problems with it! I wasn't planning on sticking with W95 so I didn't patch the PCMIA to work so I am using an age old US Robotics 56k Fax/Modem hanging off the laptops serial port. So I D/Ls Sparta Read, ANADISK, XF2.5, et cetera. I found PKUNZIP on an old C User Group CDROM, ARCX on umich, PAK on an old game site web page that was still intact.

Turns out most of my 3.5" disks were SD and I got as far as finding out SR won't accept wild cards so I had to move files one by one. Would have been nice to do a full extraction but at least I got "a way."

So I load up SIO2PC 3.17 which I had floating around on one of the 3.5" disks and the MYDOS45D.ATR from XF2.5 zip. I unplug my rust covered modem cable from the PC serial port and plug in my rust covered SIO2PC cable. I'm actually pretty happy with my default Atari setup, a 130XE with LCD composite monitor. BEEP BEEP BEEP silence! Tried it every which way but loose but no love. SIO2PC doesn't like XFD but I found a single density MyDOS ATR image and it worked. I tried creating a 180k disk under SIO2PC and it ended up just over 4 megs! I finally got a good double density MyDOS disk by booting the single density version, creating a 180k image under SIO2PC, then formating it and writing DOS files. I can't remember exactly but I do recall some problem with compatibilty sector length in the first 3 sectors. Something like they are actually 256 bytes on a real disk but the drive only returns the first 128 bytes which gave

emulator writers fits. It's been cured so long that I forgot the cure or when it happened.

More good news if only for me: I found a program I had really been looking hard for w/o any luck. I had done a screen editor that was exactly how I wanted things to work. I found a few short DEMOs I wrote at the time including a utility I wrote that crunched a Micro Illustrator picture down to a single GR12 character set if said picture was not too detailed. I will upload it somewhere just in case anyone actually has an interest. I thought it was a good demo of what an Atari could do with a redefined character set anyway. Not much value beyond that.

I fumbled around with my screen editor and time has not been kind. It is still good, probably better then most of its contemporaries, but too tuned to how I worked at the time. I didn't want a normal FONT editor, I wanted to use BBK Art to draw a picture and convert that into a single character set. Rather then have enough character sets in memory to do a whole screen I reasoned I would rather work with distinct character sets and do DL interrupts as needed. For instance a GR12 screen is something like 24 lines which requires 8 character sets in memory at one time for complex pictures. When you are storing 8k worth of character sets to represent a 7680 byte screen you are playing away from your strengths.

SIO2PC crashed on me a few minutes ago. I still have to revisit the archive me thinks and get a few more modern versions of SIO2PC or APE. Not sure if I want to go all the way to something like Altera for things other then manipulating disk images. Right now it is pretty sweet other then the bugs and crashes: ~7.5 Watts of Atari being hooked to 30 Watts of laptop and maybe 40 Watts of Color LCD screen. I be feeling green!

IMO not a lot of people do it because it isn't cost effective.
Shipping costs are<were> $12-$30 each way. I would try Bruce at
www.myatari.com as he seems to have a good inventory of parts.

IF you give me some symptoms I may be able to guess a cause.

Wrong on both counts. XF551 stock can NOT detect nor set the correct
density if it's DD. Woolley's eventual ROM can do this. Either 3.5
or 5.25.

> how come?
Tramiel?

> double density disk can not be read after

You can't have a permanent double density selection after turning on
the drive unless you re-write the XF551 OS code yourself. Woolley
provided a patch that switches densities when the current one fails to
provide a good read which is pretty close to good enough for most
folks. Maybe you didn't look long enough to find the final version of
the PD XF551 upgrade?
http://groups.google.com/group/comp.sys.atari.8bit/browse_thread/thread/de97fb67e68d8e3d

It works here for my 5.25 XF551.

More like an op ed then useful info: Yes it does update but the usenet is kind of collasping. IIRC some major players like AT&T have now dropped support. Not that it will ever completely fail but the number of ISPs providing usenet feeds is in general getting smaller. There are/were places like Supernews that smaller ISPs contracted with to provide a feed for newsgroups but as the limitations like no binaries or pictures make it difficult with the way most people like to work they migrate to web based forems. Slip and shell accounts are getting rare too.

I can't remember the last time something in UUENCODE was posted to the newsgroup or sent via email. Everybody just provides a web link now.

Odd just about describes it well. Having got rid of live mail as it was as fast as a slug on superglue, I then found some groups were vanishing their messages, then coming back then going in Outlook express. However I think I've weeded out the registry mess the uninstaller made now.
Fingers crossed.

That's kind of like asking what stone knives had to do with the strone
age.

I'm not sure if you are around many young people but they have evolved/
progressed beyond the (usenet, email, web forums). It's now about
social networking sites and text messages. Support & participantion in
the older formats is going the way of the Pony Express. They even text
you from their computers rather then email.

?Are floppy drives worth using anymore? It's getting harder and harder to find new blank disks these days. Do they still make them?

I suggest backing up any remaining disks you have (burn the images to DVD-ROM).

Would it be possible to use SDHC cards as a replacement for floppy disks? Does anyone make an SDHC card reader that will work with the 8-bit Atari's?

"jim" wrote in message news:d17d7822-3827-41e8-bde7-9ba487b4dd91@v19g2000yqa.googlegroups.com...

Jakub is already working on it. The current SIO2SD firmware (2.5) supports
standard MMC and SD cards (up to 2GB), the upcoming 3.0 firmware version
should also support SDHC.

http://sio2sd-dev.gucio.pl/wiki/Features_en

Another alternative is the "SDrive", it supports standard SD cards in
FAT-16 format only, doesn't have a LCD and is therefore a lot
cheaper to build (I paid approx. 15 EUR for the parts) - but also has
fewer features than the SIO2SD.

http://raster.infos.cz/atari/hw/sdrive/sdriveen.htm

I have both devices here and like both of them.

so long,

Hias

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Just an opinion but... it would probably have to cost more then twice that. I'm not really familiar with the VCS but I think the only sophisticated chip was the television interface adapter and it was nothing to write home about. I think it would end up needing a ~huge expensive FPGA to combine all the functions.

There are systems out there that have similar sophistication to an 8bit but they were all designed from the ground up as a system on a chip(SOC) and typically use something like an ARM processor at the core. Everything from MP3 players to cell phones are going that route. Sunplus and Rockchip were big for a while, I don't know their current status. They were user programmable with some difficulty.

Not that anyone ever learns: The field is littered with failure of one type or another. I still have a couple of Cybiko handhelds ~processing power about equal to an ST that originally sold for $100. The Dingo which emulates everything short of an X-box, sells for about $100, has had its parent company tank and reform a couple of times.

It almost prompts me to say: If there is a successful system like you describe it will be as a bonus in a cellphone. Heck, cellphones are considered obsolete 6 months after they come out so evev that would be a flash in the pan. The emulater I use on my Windows Mobile phone sucks on its keyboard reads but my son's Android seems to work well. I think both of our phones are based on ~200 mhz arm.

4312. 800 door switch hack

Newsgroup: comp.sys.atari.8bit
Date: 2010-11-30 01:40:23 UTC
From: bill@newbreedsoftware.com
Message-ID: <4cf45607$0$1668$742ec2ed@news.sonic.net>
Source record: 1051

So my son's 4th birthday is around the corner,
and my wife suggested setting up a variety of
video games.

I figured I'd set up the Atari 800 I got recently,
along with the Atari Flashback, the 7800, and the
Wii & PS2. (I have lots of monitors & TVs hiding
in the garage these days :))

Part of house cleaning involved get the damned
tank of a computer and all its bits off the
dining room bookshelf. I decided to take a stab
at 'fixing' the door switch.

Rather than figure out how to solder on short notice --
my poor soldering iron is still New In Box <8^[--
I decided to take a small scrap of uninsulated wired
and literally _TIE_ the springy switch into the 'on'
position.

It seemed to work! And, with a snip, it can be
undone (and a real fix can be made). Of course,
if I'm _unlucky_, the wire will snap on its own and
fly around loose on the motherboard and short circuit
something bad. :^/ But I'll be optomistic. :)

Just wanted to post a follow-up to my original Q from
a couple of months back :)

Fishing line would serve the same purpose. With the added bonus that if
it did break, it wouldn't short anything out.

Usenet is dying largely because all the big ISPs have dropped it due to
illegal uses of it hogging all their bandwidth.

I think most of us that are left that actually use it for legal purposes
are using free services that don't provide any binaries groups.

I just recently got an Android phone and the first two things I downloaded were Droid2600 and Droid800. Like on the PC, I had to provide my own ROMs, but they both appear to work. I haven't quite figured out how to do anything productive with them yet, due to the touchscreen interface, however. :)

If past experience is anything to go by, these are probably NOAC
(Nintendo-On-A-Chip) devices - basically, a 2600 running in emulation on
single-chip NES hardware.

Who is the manufacturer on these? I'd like to look them up.

> Could something like this be done for the 8-bit Atari computers, cheap

Probably, but I really doubt there would be enough interest to make
producing them viable. Throw a few different computers or consoles from
the era into the mix on a single box, though, and it may be a different
story.

When I was a kid in the early 80s, I always thought it would be great to have a 6502-based computer with a switch to go between an Atari and a Commodore. (Not that different from the computer that Apple ended up making a few years later that switched between PPC and Intel, if I remember right.)

If past experience is anything to go by, these are probably NOAC
(Nintendo-On-A-Chip) devices - basically, a 2600 running in emulation on
single-chip NES hardware.

Who is the manufacturer on these? I'd like to look them up.

> Could something like this be done for the 8-bit Atari computers, cheap
> enough to sell in a grocery or drug store?

Probably, but I really doubt there would be enough interest to make
producing them viable. Throw a few different computers or consoles from
the era into the mix on a single box, though, and it may be a different
story.

The new (second generation) Apple TV is supposedly getting an app store
soon. It currently costs $100 and I believe it will probably drop to less
than $50 in a few years. The Apple TV would be a great platform for
emulating old 8-bit and 16-bit computers. It has HDMI, USB and Blue Tooth so
that should take care of any peripherals you might want.

The only problem I see is that Apple doesn't like to approve apps that have
any kind of scripting capability.

I found it - It's the "Atari Flashback 2" and it's actually made by Atari
(or at least the company that is currently calling itself Atari).

Do you really need more than 2 GB to backup your floppies??

- Trevor

I don't think you can find 2GB SD cards anymore. If they're not gone yet,
they soon will be.

No, not yet :-)

But, besides possible availability problems in the near future,
SDHC support is a nice-to-have. For example you could plug the
SDHC card from your mobile/smartphone or your net/notebook
into your SIO2SD.

so long,

Hias

Thanks for that followup. I'm glad you got it fixed. Some had
suggested a piece of plastic, without opening the 800 up. Maybe
a piece of rubber eraser?

Wow! Those must've come out recently, because I occasionally
search the Android Marketplace for "Atari". :)

I just gave them the once-over. Look promising! (Droid800 is hella slow,
even at 75% framedrop.)

That's not a Nintendo on a Chip, that's an actual Atari 2600 under
the hood. The FB2 can be hacked to add a cartridge port, so you can
play original 2600 carts on it (not just the built-in games).

The original FlashBack, as well as "Atari 2600 games on a stick"
and "Atari 2600 games in a paddle", were all not 'real' Ataris,
like the FB2. They were probably Nintendo on a Chip.

One thing I noticed in particular (with the 2600-in-a-stick) was
the colors weren't right, and in Adventure, the square 'player'
sprite did not 'bounce off the walls' the way it did in the real VCS
game. :)

Unfortunately, it appears to have been made only for games - and only
those that use a joystick. There appear to be mappings available only
for joystick functionality, Start, Option, Select, Reset, and a total of
4 regular keyboard keys (the defaults are Q, W, E, and R).

Yep! If memory serves, both the Flashback and Flashback 2 were designed
by Curt Vendel at Legacy Engineering Group (http://www.legacyengineer.com/).

> The original FlashBack, as well as "Atari 2600 games on a stick"
> and "Atari 2600 games in a paddle", were all not 'real' Ataris,

I have the original Flashback, and seem to recall that it is indeed a
NOAC-based device. The games play well, but anyone who spent time with
them when they were current would know that they're ports and not the
originals. The differences aren't huge, but they are noticeable.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

If someone has the time, could you please download the ATR I attached
at
http://www.ataricorpse.com/index.php?topic=233.0

I just want to make sure it 1) Boots properly because of the
previously mentioned boot sector problem. 2) Run the program
'SHOWUNI.BAS' and see if it displays properly on an XL of something
other then Xformer 2.5? It will want to run with the ATR as drive 1.
IF for some reason you fool around with playfield editor remember
there is a bug in file I/O where something like failing to give it a
file name will corrupt DOS. I can't remember the exact nature of the
bug but I seem to recall the program would let you continue working
but when you finally tried to save your work the program would lock
up.

BTW: I mentioned on the web site too but thought I should mention it
here. I disabled registration on the web site because the spam bots
were out running real people at least 20 to 1. Not that I wouldn't
like a forem but here is good'nuff.

Hi, Rick.
I couldn't find any ATR to download at that URL. As you say,
registration is disabled.

Thanks for trying Russ. I'm not sure exactly how I set up the board
but my intention was to leave it open for reading and downloading so I
must of set something wrong. The file shows up on my old w95 notebook
off the message body in the lower left hand corner of the sceen as
'Mdos45D.ATR 180k' when I am logged in. I'll give it another shot
while logged off and see what happens.

You were of course right. I logged out of my account and the
attachment disappeared. Now I have to log into the wayback machine and
see if any of the stuff is accessable. I went ahead and enabled
immediate registration but I probabably left some other hurdle in the
way. I don't like what the net has become. Weakens us when we have to
spend a couple of hours a day killing spam bots rather then doing
something productive.

More bright side in an otherwise dismal post: I think I may have found
a brute force scroller I did in Acrion.

Rick

I successfully registered and downloaded mydos45d.atr and tried it.
It won't boot and I can't get a directory of it.

I fooled around and near as I can tell it is that problem with the
double density sectors 1-3 are only supposed to return 128 bytes on a
read but the emulators didn't get the positions in the virtual disks
right. Something like they only used the first 384 bytes for the first
3 sectors instead of 3[128, skip 128]. I downloaded XFormer 2000 and
it chokes on those ATRs too. XF25 works but nothing else does.

Thanks again for all the help. Closing in on midnight here so I think
I am going to crash. I'll switch fill a properly made ATR with the
files and get it up by monday night.

Rick

Lots of work for such a simple little program but I got it cornered. I
may have recovered the file that made the character set for the
picture too but I haven't quite got things set up for my 130XE I was
going to use for testing. Low on free desk space until I make a
recycle run of old VGA monitors and some slow desktops.

Drifting just a bit in an otherwise dead thread.
https://www.eglobalwireless.com/p-4333-new-7-mini-netbook-laptop-notebook-wifi-windows-black.aspx

I'm not buying one but kind of interesting. My cellphone has Windows,
a keyboard, and can make phone calls.<sic> Of course I paid almost 3x
as much for my cell phone. It's a close miss though. I wish they would
give the version number of CE they are using and blue tooth would be
nice. Only 128 megs of DRAM on anything MicroSloth is scary and they
don't give the limits of the SD reader: Many of them based on the ARM
only handle 2 or 4 gigs.

Punch line for me is IMO the ARM processor carries on much of the
tradition of the 6502 design goals. I imagine this thing could run
some flavor of an 8 bit emulator but would still need some serious
polish to compete with real iron. I kind of wish these things would
get some momentum behind them as I would much rather fool with one of
these over a Playstation or Xbox.

Hello!

Seems like the World
has been 8bits partitioned,
and each partition contains
only 1 to 20 persons.

The Internet connections
are interfered and the
alien authorities (fallen from the sky)
are appearing as artificial inteligent softwares,
that confuse Robocop with Robocod.

:)

Greetings,

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

"Atari User" magazine issue 4 has an article by a fellow
named Bobby Clark who took my "Super IRG" mode idea
(basically using VBI to flicker between two charsets in
GRAPHICS 12 mode, to get a perceived extra set of colors)
and ran with it.

I was checking out Atari User, and discovered there's
a conversion/clone of "Dr. Mario" (from the original
Nintendo Entertainment System & Gameboy) that's come out
for the 8-bit! (It has nothing to do with Super IRG or
Bobby's stuff; just happened to be in the same issue.
Though really, that kind of game would benefit from extra
colors ;^))

Anyway, I was always a fan of that kind of puzzle game,
and had even looked into trying to make my own (I think I
was looking at TurboBASIC XL, and it was just too slow to
do the game board logic), so I'm pleased. Though really,
this is asking for trouble... should've named it
"Dr. Atario" or something. :)

Video on YouTube: http://www.youtube.com/watch?v=HcdjLvxYg6A

I'm not actually sure of the official place to get it,
and am not sure I'm supposed to be sharing the Atari User URL,
since it seems to be a subscription magazine. Ah, but I
found it here:

Hah, I hadn't noticed.

A few things:

(1) Down at the bottoms of pages, right below where it says "Page {X}" in big letters, the links to the other pages don't seem ot do anything. (I have to go use the tiny links up at the top left in the upper frame.)

(2) Ugh, frames! ;)

(3) Ultima on carts? Where've I been? Are the carts acting as disks (a la Steve Tucker's "MaxFlash"?)

Try The Page Now Bill. I just Fixed the Problem With the Links on the
Pages.

The Ultima Carts are not using a standard Steve Tucker type setup.

So Dr. Mario for Atari 8-bit was okay, but:

(1) music was kind of hard to listen to

(2) full-drop on Down was annoying; should slide, instead

(3) in two-player mode, the other player's game would freeze for a
moment when you make a match

So E for Effort, but since I own the NES version, I won't really be
booting this up except to demo it as a curiosity. :)

Interesting!

I'm always curious, when I see your products, how the programs were tweaked compared to the original releases (or prototypes).

For example, you sell Action! carts. Are they original carts, or ones you made? If you made them, how do they differ? Do they work exactly like the original? Or are they limited in functionality (like the disk-based Action! I've seen out in the wild)?

And for some of the games... I seem to recall you(?) saying some of them were enhanced in certain ways (music, gameplay, whatever). I could be hallucinating, of course. :)

The Action Carts Are Ones that We Make and They are Fully Functional. Just
like the Original.

-- And for some of the games... I seem to recall you(?) saying some of
-- them were enhanced in certain ways (music, gameplay, whatever). I
-- could be hallucinating, of course. :)

Donkey Kong is a good Example of one we Re-Vamped a Bit with New Music.
All The Sound Effects and Music Have Been Redone By Me and Implemented by a
Coder on my staff. We also Fixed a Bug in the Code that Caused Mario to get
hit by barrels on the Girder above him when jumping. We also setup the intro
animation (Donkey Kong Jumping and Bending the Girders) to play at the start
of a new game just like the arcade.

Another Good Example is Warhawk. This is a Game that Originally Would not
Run on an NTSC System. We had to do some major Re-Coding to fix that one and
While we were at it we decided to speed up the control Response so the game
would play a bit better (Your Ship can now move around the screen a bit
Faster).

Kjmann

Merry Christmas to you too, Edward. Its been a great day, kids got a Wii from Santa and it reminded me of when I got my 800XL, around 1982 I think.

Long live Atari.

I was a wee little'un back in the day, but I, too, have
been an Atarian (2600, then soon after 8-bit, and after
college I added Jaguar & Lynx to the line-up) since
1980 or 81 or so.

Or wait, maybe that Pong we had before the 2600 was an
Atari, too. ;)

Trying not to sound like a overly-enthused fanboy, but that's a great selection of new carts and a very cool Atariesque website (love the tunes). As well, says the website, that you have a "store" that is open weekends!

It's unlikely I'll get to Oregon soon, but if I get anywhere near, I'd have to check that out! Can you perhaps post some photos of the interior?

Do all your carts have nice labels? Sinistar, Space Dungeon, Star Island?! Man, I had forgotten the early vectrex Star Island stand-up arcade machine, it's definitely cool to see an 8bit cart of it! The Ultima series (you're not the first to offer IV though).

Praise aside, I must say that I think you should include a statement that you're willing to take down any ancient software entry on notification by the author that's its unwelcome. I hope that in the case of Yoomp and ones like that that you're sending a royalty, however infinitesimal, to the authors.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

4363. Painting ideas

Newsgroup: comp.sys.atari.8bit
Date: 2010-12-30 08:09:24 UTC
From: bill@newbreedsoftware.com
Message-ID: <4d1c3e34$0$43993$742ec2ed@news.sonic.net>
Source record: 952

I bought my wife a copy of "Art Academy" for her Nintendo DS (which has a stylus-based non-pressure-sensitive touch screen), and am intrigued by how well things can come out with, basically, the same input as we have on the Atari with a Touch Tablet or Koala Pad (the only difference being the buttons needed to tell a program when you really want to paint, vs. when you are simply positioning the cursor) or Light Pen.

See: http://artacademy.nintendo.com/

which has a video, and:

http://artacademy.nintendo.com/gallery/

which is a gallery of some example art.

The things it really seems to need to do something like this is:

1. Blending of previous pixels with pixels from the new stroke
2. Randomized (or faux-randomized, via a set of 'frames' that are cycled through) pixelization of the brush area
3. Fade-out of brushes
4. Angled brushes; i.e., if you stroke left to right, the pixels come out like this: ||||| If you stroke up to down, like this: =
=
=

#1 could be ignored due to the pixelization from #2 and #3, though the results would simply look like a really carefully drawn bitmap in, say, 4 colors. Yuck. :)

#2 and #3 could be handled with a set of pre-rendered brush shapes at varying degrees of solidness. i.e., for a fade-out effect as you paint, it would go from a shape like:

#
to: # ### to: # # # to:
#
#

And for randomization, simply have a handful of these fade-out sequences that you cycle or randomly-pick from.

For #4, that's trickier, I think. It might be possible to have a set of, say, 180 bitmap masks, one for each angle you'd have to draw at:

If we only cared about 4 angles (0, 45, 90, 135), they'd
be something like:

```
----- ---### --#-- ###---
###### --###- --#-- -###--
###### -###-- --#-- --###-
----- ###--- --#-- ---###
```

Really, you only need 1/2 as many masks as angles you
want to support, since you can re-use the ones for
<90 degrees, flipped over, for >90 degrees.

Getting back to #1, I had an idea for a VBI-driven
graphics mode that doesn't do any DLI tricks; it
simply takes 2x memory and 2x time to produce an
image. You could have Red, Green, Blue and Black.

When you draw some red across the screen, it would
draw on both frames, but the randomization and
fade-out effects would cause them to hit different
spots in each frame. [*] It'd be solid red,
interspersed with dark red (red+black VBI flipped)
and black.

```
-RRRRRRrRrrRRr-r--r-r-----------
RRRRRRRRRrRrRrRr-r-r--rr---r----
RRRRRRRRRRrrRrrRr-r---r--rr-r---
RRRRRRRRRrR-RRrr-rr-r--rr-r-----
-RRRRRRrrRrRrrR--r--rr-r--r-----
```

And imagine the same when you paint other colors
on top of each other (e.g., blue over red;
you'll get some red pixels next to blue, as
well as some VBI-driven purple pixels).

I'm kind of tempted to whip up a little
libSDL-based app on my Linux laptop to demonstrate
how this would work & what it would look like
(including flicker). :)

4364. Photo viewing idea

Newsgroup: comp.sys.atari.8bit
Date: 2010-12-30 08:20:01 UTC
From: bill@newbreedsoftware.com
Message-ID: <4d1c40b1$0$43993$742ec2ed@news.sonic.net>
Source record: 953

Ever since long, long, long, long ago... back when
I first learned about APAC and ColorView modes,
I thought it would be really handy to have a program
(e.g., on a fast, modern computer) which would
create an interlaced bitmap image (like an APAC or
ColorView mode), but which also includes palette
information.

In other words, every vertical row of pixels
(scanline), determine the best palette to use,
rather than _always_ using red/green/blue.

Imagine 160x192 APAC mode where, instead of
64 colors total, you have the potential for
64 colors _per scanline_.

Take this photo, for example:

http://upload.wikimedia.org/wikipedia/commons/a/a6/Knysnasunset.jpg
(thumbnail here: http://en.wikipedia.org/wiki/File:Knysnasunset.jpg)

It goes from dark blues into some blues & purples,
then to golds and browns, then golds, browse and blacks,
etc., as you go down the picture.

The Atari has 128 (or 256 if in GTIA modes) native colors to choose
from, so it seems reasonable to be able to use more than just 7 of
them (red, dark red, blue, dark blue, green, dark green, black) to
make a nice picture, no? :)

This could also lead to a hybrid mode, somewhat like the mode
I mentioned in my "Painting ideas" post from a moment ago,
where you could use a pair of 160x192 screens (rather than three
of them), with per-scanline palette choices blended together.
That'd allow for 16 perceived colors per scanline, which is
still a hell of a lot better than 4... and it'd be less flickery
than a Colorview(-style) mode.

My problem is: I'm not that good with the analysis stuff.
It might be possible to cobble together output from tools
like NetPBM or ImageMagick to construct a pair or trio of
images, and colors.

The hard part is insisting that it quantize down to 16 or 64
of the 16,000+ _possible_ colors. Emphasis on "possible."

So who's up to it? :)

Well, it's been done. Not too surprising. :)
Thanks to Bobby Clark for pointing it out.

See "XL Paint Max", here:

http://madteam.atari8.info/index.php?prod=uzytki

It seems to come in two flavors... 6502 & 65816!

It giving you 16 colors to choose from.
The default colors it comes up with are:

* Black
* Dark Grey
* Medium Grey
* Light Grey

and:

* Black
* Red
* Green
* Blue

MAD TEAM also created a Win32 app called
"Atari Interlace Studio" for manipulating
bitmaps and converting them into the interlaced
mode for the Atari.

4366. Old systems & modern TVs

Newsgroup: comp.sys.atari.8bit
Date: 2011-01-03 03:54:34 UTC
From: bill@newbreedsoftware.com
Message-ID: <4d21487a$0$44039$742ec2ed@news.sonic.net>
Source record: 955
Cross-posted to: rec.games.video.atari,comp.sys.atari.8bit

So I inherited a modern CRT-based HDTV a while back; a Philips 27PT832025
(man, that's a mouthful).

It has some features which make older game systems & computers look
worse that they would on an olderr TV or, e.g. Commodore monitor.
One day, I'll need or want to replace this TV and I'd like to get
something that can do a reasonable job with things like:

* Atari 7800 via RF
* Atari XL via composite (I should do S-video some day)
* Atari Jaguar (via S-video)
* Sega Genesis (via S-video, IIRC)
* Nintendo (NES) via composite

Particularly annoying are artifacts (usually stripes of horizontal lines)
when things flicker. e.g., some of the higher-color or -resolution
software-driven modes on the XL, or player/missile (sprite) re-use in
2600 games (e.g., Asteroids).

Another thing I've noticed reminds me of a scaling feature I've seen
used in emulators to provide a smoothed, cartoon-like effect when the
emulator window is enlarged beyond the emulated system's natural
resolution; as opposed to simply throwing up big blocky square pixels.
It seems to detect when there's stair stepping (e.g. in a / shaped sprite)
and adds in-between pixels. Sometimes... not very weel, and not very
appropriately. :-(

I downloaded the manual for the TV (*) and it lists some features which
I think are to blame:

* ActiveControl TM - auto-corrects picture (sharpness, etc.)
* Eye Fidelity (aka Digital Options) - for Progress Scan vs Interlaced

Switching around various options, I've never been able to get my older
systems to look very good. The Jaguar, mostly doing VLM these days,
certainly looks a lot nicer since I bought an S-video cable. Mostly
it's the older Ataris that have trouble.

Fortunately, it seems to be okay accepting the PAL output of my 800XL
(just swapped ANTIC chips), which is nice. Other TVs haven't done that;
mormally what I'd use was the C= monitor, and fiddle with its V-Hold knob.

So, to the other gamers & Atarians out there... what kind of TV 'features'
should be avoided? Our next TV will probably be a non-CRT flatscreen
HDTV who-haw, since they're finally coming down in price.
Any recommendations? I wonder how a Fry's or BestBuy would deal with me

brining a 7800 and/or 800XL into their store... ;)

(*) A Google search lead me to numerous sites that'd sell me a PDF of the manual for ~$10. Simply going to Philips' website & entering the TV's model in their search brought up the manual at no cost. I feel sorry for the naiive web users. :-/

Trying not to sound like a overly-enthused fanboy, but that's a great selection of new carts and a very cool Atariesque website (love the tunes). As well, says the website, that you have a "store" that is open weekends!

It's unlikely I'll get to Oregon soon, but if I get anywhere near, I'd have to check that out! Can you perhaps post some photos of the interior?

Do all your carts have nice labels? Sinistar, Space Dungeon, Star Island?! Man, I had forgotten the early vectrex Star Island stand-up arcade machine, it's definitely cool to see an 8bit cart of it! The Ultima series (you're not the first to offer IV though).

Praise aside, I must say that I think you should include a statement that you're willing to take down any ancient software entry on notification by the author that's its unwelcome. I hope that in the case of Yoomp and ones like that that you're sending a royalty, however infinitesimal, to the authors.

Honestly I think you came up with the killer app for an Atari in the
new milenium: Let <10 year olds play Pong and Pac Man. I've been

breaking in my grandkids and they love the old games. Makes sense that a 4 year old would prefer Pac Man over Halo or WoW.

Something that will never get off the ground but I have been thinking on video hardware hack. Your probably familiar with some of the video hack$$$ but I was thinking about something Cortese'esk. There's a ~20¢ IC, 74LS166, that loads an 8 bit byte and clocks it out serially. They were used in everything from Timex to Jupiter to IBM PC computers to output video. Bob Wooley used them in at least one of his video designs too, his 6545 80 column hack IIRC.

What I was thinking is there are at least two ways to 'cheap load' the chip with data. You could use the address line toggle like the OSS carts or use decoding like the bank switched carts. The thing to do instead of activating the toggle with the 6502 you make it active when the ANTIC is in control. The '166 would need its own RAM, something like a 8 bit by 8k would be plenty. All you would have to do is have the ANTIC address lines drive both the existing memory and the 8kx8 chip. This would make 16k available w/o any flicker so you could do 320X4 shades or 160X16 shades. It could be done for less then $10 but the standard 'it will cost and arm and a leg if custom boards need to be made' applies.

Rick

>
> What's everybody doing with their 8bit these days?

About six years ago I after having discovered A8 emulators I stumbled my way in here just as you are now.

I found enjoyment from all kinds of new software and hardware and I rediscovered my old favorites.

The first thing of note would be an SIO2PC cable. With this and a disk emulator which will run on just about any contemporary computer I was freed from the A8 floppy disk!

later on I learned that many mass storage devices have appeared since the days of MIO and Blackbox. Actually both of those arrived after my prime Atari days. If you are handy with a soldering iron these are some of the newer options. IDEa and MyIDE IDE hard disk interface. These connect to the bus but only IDEa is a proper PBI device. Both work great with CompactFlash adapters. On the SIO bus we have SIO2IDE, SIO2SD, SDrive. SIO2IDE and SDI2SD are exactly what their names imply. SDrive is also an SD interface for SIO. I have a MyIDE kit and SDrive kit and an SDrive I built from scratch (ok that's a barebones adaptation which I built for less than $10). I love them all

Here's a partial list of great software that has appeared or has been revised since my return to this wonderful hobby.

Games

- Jelly Beans
- Flowers Mania
- Yoomp!
- Tempest Xtreem
- Xenophobe (complete prototype)
- Super Pacman (completed/fixed by author)
- Crownland (PAL only)
- His Dark Majesty (RPG/strategy)
- varioos ports from other platforms
- fantastic works in progress
- hundreds of new, previously unreleased, or rediscovered lost games

Utilities

- SpartaDOS X revisions
- Real.DOS
- FC (recursive file copier)
- high speed SIO driver (up to 6X)
- A8 cross assemblers and compilers for Windows and Linux
- The Last Word (new word processor)
- alternate ROM OSes
- contiki (OS)

Here's some more of the new hardware available.

- VBXE(advanced graphics enhancer)
- user programmable multicarts (Atarimax flashcart is the grandfather of these and still one of the best)
- RAM upgrades (classic DRAM, static RAM, SIMM mods, more)
- Turbo Freezer 2005 (save states, emulate carts, more)
- stereo sound
- video enhancements and adapters
- USB cartridge (connect some USB game controllers)
- SIO2USB (connect USB thumb drive)
- ethernet cartridge (work in progress. works with contiki?)
- 32-in-1 OS (also DIY multi-OSes)
- XL7 accelerator (work in progress?)

Most of the hardware is DIY. Some can be purchased. There are also people who build and install the upgrades for modest fees.

I'm sure I left out a lot.

-Steve Sheppard

Mostly gaming. Not much time for else. Last year and the year before
(and hopefully this year, too) I've done an Atari party out here in
Davis, Calif:

http://www.newbreedsoftware.com/atariparty/

:)

I am waiting for my VBXE 2 board :-) Can't wait to test this beauty. And
Star Raiders, Rescue on Fractalus, Ballblazer, Bounty Bob, M.U.L.E. are
still among the best games ever.

Long live Atari

Take Atarian care

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Entries do not include an email address due to the overwhelming amount of spam that would result.

Internation Reply Coupons

The following is from: (2010.09.12)

http://www.upu.int/en/activities/international-reply-coupons/about-irc.html

About International Reply Coupons
When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country; however, if they are from different countries, the enclosed postage stamp will not be valid.

All member countries
This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. As the service began before the days of airmail, the earliest coupons could only be redeemed for a single-rate ordinary postage stamp to a foreign country. In terms of today's UPU Convention, International reply coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

Mandatory to exchange
The UPU's International Bureau processes several million coupons each year and deals with of all accounting aspects. The International Bureau does not sell IRCs directly to customers; they must buy them from their local post office. Although Posts are not obliged to sell IRCs, it is mandatory for Posts to exchange the coupons. If a Post does not sell IRCs, it is possible to purchase them in a post office located in a neighbouring country.

DISCLAIMER

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

4378. "Project-M" (Wolfenstein 3D)

Newsgroup: comp.sys.atari.8bit
Date: 2011-01-10 06:26:51 UTC
From: bill@newbreedsoftware.com
Message-ID: <4d2aa6ab$0$44012$742ec2ed@news.sonic.net>
Source record: 967

Don't have links handy, but search for "Project-M" by NRV. It's a game engine utilizing artwork from Wolf3D (from MSDOS, and the frst 3D FPS (first-person shooter) by id Software, who made Doom & Quake) & even remade music.

It uses APAC mode (narrow mode, so 64x(something)x256 colors) and runs at a good framerate (15-22fps on my NTSC 800XL that happens to have a PAL ANTIC inside). Controlled by joystick, or keyboard; includes strafing. ;) Nothing to shoot at yet, but some invisible (til you grab them) keys let you open doors & explore more rooms. (Look for hidden doors, too, just like Wolf3D ;))

Vids on YouTube, files at AtariAge. Enjoy!

Version 2.0 and it looks damn amazing if this is non-modded (no VBXE) ...
They should make an RPG with this. In awe :-)

Take Atarian care

I wish SSI would have ported the Pools of Radiance series to the
Atari. The first installment were written in Pascal and you could
play the game off a single 1.4 meg floppy. IIRC that 1.4 meg floppy
was a full install with both CGA and EGA graphics and sound files. IMO
could have easily been done on an Atari in a tighter language or ML on
a couple of disks. The C64 got it anyway and game play was essentially
identical to the IBM.

Probably only me but ST/EGA level graphics i.e. 320X200 in 16 colors &
640X200 in 4 colors would have held my Atari interest better. Not that
many people seem to be into old ST or EGA games at the momment but I
still boot them up from time to time..

Rick

I'll take anything on my old 8bit. :)

I have to disagree here - from my perspective, there are a lot of people
who are "into" old ST games. :)

4382. Plans surfacing for Atari Party 2011 in Davis, California

Newsgroup: comp.sys.atari.8bit
Date: 2011-01-11 18:10:37 UTC
From: bill@newbreedsoftware.com
Message-ID: <4d2c9d1d$0$44000$742ec2ed@news.sonic.net>
Source record: 971

I'm hoping to do Atari Party 2011 some weekend in May, out here in Davis, California. (About 1-2hr east of points in the greater SF Bay Area, and about 20 mins west of the I-80/I-5/99 interchange in Sacramento.)

I'm planning on using the same venue we had in 2009, a large meeting room at the local public library. We were unable to use it last year, and had to pay $$$ to rent space from the City, due to rennovations that were taking place. Now, the room we'd be using is larger, has a built-in ceiling-mounted video projector, and has a small conference room in the back. This opens up some fun possibilities.

Last year, we rented and screened the original "Tron" (thanks also to some cash donations), and we may screen it, or some other movie, again.

For more on 2009 & 2010 parties, see:

Ok, guess I should post here ...

I used to tinker around with the lovely Atari 130XE back in the day, even wrote a few BASIC games, one of them is called Sky Scraper, a 40 level platformer which I think you can download from the Atarionline.pl site ...

In 2009 I discovered Atari 8 bit emulation and have gotten back into it ... and what else have I done? Umm, discovered 18 new Graphics modes for the old Atari ... all of these inspired by that Super IRG mode that Bill Kendrick used in his Gem Drop game ... I took that idea, expanded it, and we now have an APAC text mode (Graphics 0 but with APAC characters), a HIP text mode, and a couple of CIN text modes which will let you display ANITC 4 characters in as many as 80 colors.

Also writing a font editor which will edit in Super IRG and these other 18 modes. I've actually got a few Beta versions ready but they probably still have a few landmines in them.

This is what happens when you have a lot of free time on your hands. :)

4384. ATARI and Spectrum are rubbish - The C64 is the king of home-computers!

Newsgroup: comp.sys.atari.8bit

I don't understand why people are still using crappy doorstoppers like the Sinclair Spectrum and ugly black and white heaps of trash like the ATARI 800 XL.

Both of these computers failed in the 80s and look at the graphics of the Spectrum - ugly, monochrome, no scrolling and no sprites.

The ATARI has only 3 ugly colors, ugly sprites and bad scrolling. 99% of ATARI games are crap.

All the games are MUCH superior on the C64 and the C64 truly is the king of home computers!

So please throw away your ATARIs and Spectrums and buy a C64 on ebay!

Very poor, 1/10.
Hints on improving your trollery...
1: restrict your trolling to a single computer and group. Including both
atari and sinclair in a single post just smacks of laziness.
2: Stick to the facts. Lies never did the trick.
3: on second thoughts, just give up, you've not got the nack and you never
will...

Considering the Atari 8-bits can do 9 paletted colors (or 5 paletted via sprites, plus 16 shades) per scanline, you must be confusing it with Atari Pong. ;)

I admit, I've been jealous of the C=64 for the sheer number of games that kept coming out long after the 16-bits showed up, but honestly, if I were to 'upgrade' from my 800XL and 1200XL, it'd be an Amiga of some sort. I could never stand the C=64 BASIC & OS... so clunky. (Being an Atari guy made the switch to Unix/Linux easy ;))

There were times when trolls bothered and at least tried to get their facts straight (well, except for Sinclap, that is) when starting a flame war.

But this one is way too late, as all thes obsolete computers are dirt cheap nowadays and can easily be tested on emulators as well as Youtube videos.

The C64 has a very good sprite engine for it's time (best of the three), and good sound (also presumably the best of the three).

The A8 had less freely distributable colours (usually just 4 per line except for mode 10 with only 80 pixels horizontal resolution and 9 colours and mode 12/13 - multi-colour text modes with the inverted bit generating a fifth colour - mode 9 and 11 each have 16 colours), but can change graphics modes, colour and player/missile registers between lines (a capability inherited from the VCS, but relegated to ANTIC) and has great scrolling and overscan capabilities. The sound isn't too bad also, but good results apparently require more CPU cycles than than the C64 needs to achive good sound with the SID. It also has a significantly faster CPU, which helps a lot in games like Rescue on Fractalus.

Depending on the programmers' talents and game type, either one may have the better version of a game, but the C64 has the much larger library due to it's greater success.

The Sinclair has no sprites, bad sound, only two colours on any 8x8 pixel grid, yet it is astounding what programmers achieved on such humble hardware (the Speccy version of Starglider e.g. looks incredibly fast for an 8-bit computer). One should also not forget that the Speccy was created as a no-frills, entry-level computer for a bargain price, while the A8 were very expensive when first published in 1979 and the C64 had the advantage of vertical integration with MOS - resulting in the better price/performance ratio.

A scroller of the speccy (e.g. from 'digital brains' software) is
scrolling as smooth as a scroller of the amiga (e.g. from any intro),
when using emulators on PC.
I have that another way within my recollection ;-)

Emulators.... tsk

I was impressed by the XL and the C64 at that time, too.

With an one year timeout from my 'm.i.a.' Atari VCS, it became a Speccy
48K plus 8 Cassettes ~1983. Always like/d its high-res...

Spellbound, Jet-Pac, Dragons Bane and many more... Manic Miner, Knight
Lore, Cascade Cassette 50 etc.

The atmosphere in many games is unique to me. Sound-FX are ok and
differentiable.

Surely troll posts are distributed denial of service attacks in a broad
sense - the more people feed the troll, the more crap piles up in
people's spools thus slowing down the process of reading Usenet.

Well I suppose if we all changed the sub line and made it clear then people
would not actually bother to read stuff which is both off topic and rubbish.
I would advise anyone reading via a web interface to get themselves a news
reader, Even Microsofts clients are better then web interfaces. One can
just move down a line and look at what interests them and the rubbish simply
does not matter if its here or not.

So atarians and commodes have flamewars too eh?
Seem to be a thoroughly disagreeable lot, the commode users.
Speccy users have never had any beef with the atari users.

I would agree that the Timex-Sinclair 1000 (the slightly modified
ZX-81 sold in the US) was the only entirely closet-compatible computer
I ever owned.

> So please throw away your ATARIs and Spectrums and buy a C64 on ebay!

Yeah, like Rescue on Fractalus, Star Raiders, Bounty Bob Strikes Back (ok, C64 version was okay, but I think the Atari one is better) and Ballblazer ... And M.U.L.E. (4 port Atari 800 rules) ... And Dropzone ... Oh, hell, most of my favourite games are superior on the Atari. I do have C64, C128, Vic20, +4, C16, but they are not the same to me.

One thing that is better on the C64 is George Feil's Synth Sample 3 (the spacey tune) ... That's brilliant, but strangely enough, I don't play many games on the C64

For me, it's Atari, always (old Atari, not the crappy company they are now)

You call this a flamewar? Pah!

> Seem to be a thoroughly disagreeable lot, the commode users.

Actually, I quite like the Commode. It had a good version of
Ghostbusters - well, the theme music was cool. In fact, I might just
go fire up one of the C64s now...

hang on...

Damn. It's not working - it looks like the power supply failed.
Wait, I'll find another PSU. ...

Nope. I think that one fried too. I'm sure I've got another one...

Damn. That one seems to be fried.

Oh well. Back the the +2.

Hmmm, bad choice... Not that the commodoe didn't have any good
conversions, but Ghostbusters is better with the XL Version by miles.
Even the sound is, in that case, more atmospheric (funky). M.U.L.E. is
an other game (also with better sound) and many more games.
Four channels is definetely more than three ;-)

Spending CPU time for sound can deliver fantastic effects (e.g. Hall),
not to forget the vacuum-cleaner like out of phase (standard) sound.

Nice computer! Expensive though...

4407. Convert GIF to Super IRG 2 and other character flip text modes

Newsgroup: comp.sys.atari.8bit
Date: 2011-01-18 06:02:56 UTC
From: Bobby Clark <synthetikfm@gmail.com>
Message-ID: <ab4a36de-dfd6-45f8-b1e9-ff602c8d34af@t35g2000yqj.googlegroups.com>
Source record: 996

Hi everyone ...

As you may know, I have been doing some work with 18 new characterflip display modes that I came up with, based on Bill Kendrick's Super IRG. One thing I am wanting to do, is to convert GIF and other PC graphics formats to some of these new modes. For right now, I am concentrating on trying to come up with some way to display GIFs using Super IRG 2 and Super CIN, as these seem to be the best of the 18 new modes.

Super CIN looks to be the easiest of the two. It's basically the text equivalent of the CIN bitmap (160x192x64 color) mode. This is an ANTIC 4 based mode, which flips the GTIA between normal and Graphics 11 every VBLANK, flips COLBK between 0 and 4, and also flips the display list between ANTIC 4 and ANTIC 2, so that the ANTIC 2 shows everytime the screen is in Graphics 11. The result is, characters that can display any of 64 colors at 4x8 resolution, and a total 80 colors displayable.

What we would need is a means to come up with a monochrome 160x192 Gif file at 5 shades, and maybe use G2F to convert it, and save a character set. The other half of this display is a Graphics 11 bitmap derived from a color version of the same GIF file. I have a means of converting this picture into character fonts from BASIC.

The idea is, I will be setting up a display list interrupt every 3 lines (4 lines if using narrow playfield) with each DLI change pointing to the next character set. These get flipped every VBLANK along with the GTIA, COLBK, and display list. You can get 15 character rows of display on normal playfield, and 20 rows if you use narrow playfield.

I believe that I can do a decent GIF display in Super CIN ... thanks to Graph2Font.

The tricky mode, however, is Super IRG 2. This is like Bill Kendrick's Super IRG, except for playfield registers 708-711 getting flipped every VBLANK, allowing 23 colors (16 per character cell) at ANTIC 4 resolution. This should theoretically allow you (using the DLI method above) display 12 character rows of a GIF in normal screen and 16 in narrow playfield. Decreasing your color resolution by flipping fewer regsiters (or maybe not using the ANTIC 4 5th color and sticking with 16 colors) will allow for more rows.

My questions is this: Is there an algorithm by which a GIF file can be converted down to 160x192x23 colors, with those 23 colors being

composites of the 4 atari playfield registers (708 through 711). Keeping in mind, there are 16 colors in ATASCII 0-127 in Super IRG 2, while in inverse characters (ATASCII 128-255), colors 17-23 will replace colors 10-16 (these are all composites of PF2 for normal and PF3 for inverse). So there is the added provision that colors 10-16 cannot occupy the same 4x8 character grid as colors 17-23.

I did some calculating, and believe that there is a palette of 8,256 colors you can choose from in Super IRG and Super IRG 2. This is based on 128+127+126+ ..... +2+1. So each one of these colors will have two composites from the 128 colors in the non-GTIA Atari palette.

A lot of my polish Atari friends are excited by Super IRG 2 and were looking to prepare some pics for display in this mode, and some of my other ones ... but it is an interesting puzzle, trying to come up with composite Atari colors to make up these 23 from any GIF. So, the question is: Any enterprising programmers want to give this a go? :)

Sorry if any of this goes over anybody's heads. I really think this is virgin territory as far as Atari 8-bit graphics are concerned.

I don't know much about the history of C=64, so I didn't know that.
Thanks for sharing! :) (That reminds me, I have a book on the 64
on my Amazon wishlist that I should finally just go ahead and purchase.)

My brother had the C=64 (and lots of games). I had the Atari (and few
games, but a powerful BASIC to keep me busy writing my own ;))

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

It does, doesn't it? I wouldn't mind picking up a Spectrum if it was available cheap. Does that mean I shouldn't have been so quick to observe that the attempt to start an Atari / Spectrum vs Commie flamewar on Usenet in the 21st century is absurd (though a bit quaint)?

Yes there are still Atarians out there who still use
their Atari computers. I still have my old Atari 400. It still
works, but I use a 130XE now. Have two of those. All still
work fine like they did when I first bought. Have tons of
games and apps that I enjoy loading. Take your Atari computer
out of the box and step back into time. Haver fun.

Message-ID: <91928c41-7911-41fa-8f2e-608a465ac527@t23g2000vby.googlegroups.com>
Source record: 808

No big thing but I went by Weird Stuff and they had a couple of Atari items. A 5200, 9 volt transformer, and an 810 drive. Someone emailed me about a 5200 a while back but I flaked out. Been spending too much time doing 'interpersonal' stuff to check my email. ;) If you happen to be traveling through SF Bay area and are looking for those items, you may want to swing by their store. I don't know if they would sell them to you off the web page or by phone.

I gotta say the recession has got the blood running in the streets. They had a row of 2+ gHz Dells for less then $100. Not a lot of directly Atari related stuff but some close misses. I spotted a Supra 14.4k fax/modem in a cardboard box full of various brands. Everything was 10% off because they are moving. Such is the Intel side of things, stuff you went w/o going on vacation to afford like 32 meg dimms<?> are going for a couple of bucks.

I still have my Commodore 1702 and will probably keep it until the day I die. The same can't be said for CRT VGA monitors! In 10 years the only way you will find them will be with a metal detector and a shovel.

Rick

4420. New group for female ATARI programmers - "ATARI Girls"

Newsgroup: comp.sys.atari.8bit
Date: 2011-01-24 21:34:22 UTC
From: ATARI Girl <atarigirl@ymail.com>

Source record: 809
Cross-posted to: alt.atari,alt.games.video.classic,rec.games.video.classic,comp.sys.atari.8bit,comp.sys.atari.st

Hi,

there are still people like Tony Simsig who think that women are too
stupid to program software for computers and to prove him and other
men who think so wrong, I've created the group "ATARI Girls":

http://groups.google.com/group/atari-girls

This is a group where female programmers can show their programs,
tools and games.

Men may also join, but I don't want guys like Mr.Simsig on the group,
since I hate flame-wars.

On the group, girls may show what they're capable of. You can send
your code to atari-girls@googlegroups.com by email. You may also send
executable files and screenshots as email-attachments.

If you need more room, you can use other services for hosting your
data and you can then provide the links.

This is no dating group, so men, please do not approach girls.

And now, have fun,

ATARI Girl

I think of them more as "amuse" than 'Abuse'. They make me laugh.

> Is anyone even looking after Usenet any more?

AFAIK, Usenet never was a moderated system. Had it been moderated,
I doubt all the flaming would have had a chance to even exist.

>
> Where did you get the powerful BASIC from?

Well, I got mine from an issue of the magazine "Happy Computer", it was named "Turbo-BASIC XL 1.5"
<http://en.wikipedia.org/wiki/Turbo-Basic_XL>. Had to type it in, though. Other good BASIC dialects for the A8 usually came from OSS, but were way too expensive this side of the pond.

If you aim for power, though, nothing except 6502 assembly matches ACTION! <http://en.wikipedia.org/wiki/Action!> - sadly, this language was never ported to any other system (e.g. the C=64 or Apple II).

>But Atari BASIC was matched
> only by Commodore for being bloody useless.

ACK, the Atari BASIC wasn't good at all: slow, having a strange string handling and only few commands for graphics and sound, But what was important for Atari at the time: it only needed an 8K cartridge, and it was finished in time. You have to remember ROM and RAM were very expensive back in 1978 and MS BASIC needed more than 8K ROM on the 6502.

There is only one thing I liked about Atari BASIC, now that I think of it: the ability to use shortcuts (e.g. "G." for "GOTO" and "L." for "LIST").

Should not be needed really if people were not so set in their ways I
suppose.
Personally, I've never seen why one would suggest any gender is better than
the other at programming, its just what you are interested in and grasping
concepts after all.

Maybe its just men who like playing with old stuff, or that might be seen
as daft!
Nostalgia ain't what it used to be.

LOL :)

My current HD CRT, and the previous (which broke) were both free hand-me-downs
from friends who upgraded to wall-sized plasma or what-have-you.
One of the TVs I ended up salvaging for Atari Party was a old wood-grain(!)
beast that was hiding in my chiropractor's barn, cover in spiders.

I wish there were an HSC or Weird Stuff closer to where I'm at (Davis). :^/

I'm thinking it'd be nice to have an arcade-style stick for my Atari
systems. (I currently have a few CX40s, a pair of 7800 Pro Controllers
(which really hurt to use!), and a handful of Sega Genesis 3-button gamepads.)

I'm thinking of maybe getting one of these, or some knock-off:

http://www.amazon.com/6-Button-Arcade-Stick-Sega-Genesis/dp/B00002ST86

Any Atarians out here have any experience, or recommendations?

Well, compared to what I saw on the Apple II (which I basically considered to be a joke of a system, as a kid ;)) and C=64 (which had no pixel graphics or sound commands in BASIC).

Eventually, yes, the slowness and lack of a number of useful functions (more graphics, sprites, etc.) caused me to switch to TurboBASIC XL once I discovered it. It still lacked sprites, but by then I had some books that explained how to set them up (via POKEs), and TBXL had some memory move functions.

> I've used several BASICs, BBC BASIC on the Z88 being a favourite,
> nicely tied in with the OS and it's channel-based control commands. I

> only by Commodore for being bloody useless. If you have to enter POKEs
> to get anything done, then it's not BASIC it's slightly easier
> assembly. That doesn't actually assemble, now I think of it.

Nah nah nah. :)

```
10 GRAPHICS 8
20 SETCOLOR 2,0,0
30 SETCOLOR 1,0,15
40 COLOR 1
50 FOR X=0 TO 359 STEP 3
60 PLOT X,0
70 DRAWTO 359-X,191
80 SOUND 0,X/2,10,8
90 NEXT X
100 SOUND 0,0,0,0
```

C=64 BASIC did not make that kind of functionality accessible, from what I remember. It all had to be done with POKEs and SYS calls, no?

It also provided feedback on syntax errors immediately.

10250 REM SOME SUBROUTINE THAT RARELY GETS GOSUB'D
10260 PRONT "HELLO"
10270 RETURN

would result in an error the moment you entered line 10260.

I remember being uber-frustrated by Apple II's BASIC because
it would only check syntax as the program ran. So if you have
a 1-in-a-million chance of ever landing on a line of code,
you had that much chance of knowing you made a typo. :^(

Also, I seem to recall C=64 BASIC had 2-character limits on
variable names. e.g.

10 CARS=10
20 CAT=0
30 PRINT CARS

oops :(

Correct. There were many later add-ons to expand BASIC with lots of useful new keywords, but they never really caught on that much. Commodore themselves distributed Simon's BASIC, which added a lot of much-needed commands: http://en.wikipedia.org/wiki/Simon%27s_BASIC . (A lot of utility cartridges also added commands that were meant more for use in immediate mode than in a BASIC program itself; I had a Final Cartridge III -- http://en.wikipedia.org/wiki/Final_Cartridge -- that was truly spectacular back in its day.)

> Also, I seem to recall C=64 BASIC had 2-character limits on
> variable names. e.g.

This was true of many BASICs of the day -- Apple had the same limitation.

True. More functionality came with BASIC 3.5 in the
Commodore Plus/4 and BASIC 7.0 in the Commodore 128.

True, but neither did the stock Atari BASIC. There where BASIC enhancements like Simon's BASIC that added similar commands to C= BASIC. Ofcourse, then there was the problem that your programs would only work for people who had the same enhanced BASIC.

It all had to be done with POKEs and SYS calls, no?

ML is really the only way to make use of graphics and sound on the old 8 bitters anyway, if you're talking games and programs that required any kind of speed.

I was spoilt in that I had a CoCo2 with Extended Colour BASIC which had a decent BASIC but it was still hampered by it's lack of speed.

CoCo2's Extended Colour BASIC sounds like what I grew up on - TI
Extended BASIC... had an excellent set of statements and commands, but
was pretty slow...
It did not support line-graphics, being that the graphics chip
originally used on the 99/4 had no bitmap mode - the 99/4A added
bitmap. It was a character-based graphics system, even the bitmap
mode...

But the sprite statements and sound statements were most awesome. So
were the user-defined subprograms with local variables. Too bad BASIC
was too slow to do much in...

I started programming on a Timex-Sinclar 1000(that I still have but
doesn't fully work, and then TI99-4a), which I wrote for and had no
way of saving the programs at first but learned a bunch about basic
before I got my Atari 800 with 410 recorder(still have but upgraded to
a 130xe). I still like to play with basic programming on the 130xe
and would like to try and convert some of my Flash games I have made
to the Atari 8 bit machines. Here is a link to some my Flash games on
my Flash gaming site. http://www.thepixelcastle.com/cat/4/Originals/newest-1.html
I am sure some I can do easily and some might take little more work,

but the challenge should be fun.

That, right up there, is stock Atari BASIC code. (The kind you'd get
on cartridge for the 400, 800 and 1200XL, or which was built-in on
the alter models: 600XL, 800XL, 65XE, 130XE, XEGS.)

<snip>
> ML is really the only way to make use of graphics and sound on the old 8
> bitters anyway, if you're talking games and programs that required any kind
> of speed.

Yes, truly. On the other hand, as a young kid (I was about 7 or 8 when
I got my Atari 1200XL), BASIC was _incredibly_ accessible as a programming
language, and I have hundreds of 5.25" floppies rotting in my closet with
old games and other programs I wrote for myself in BASIC.

I would have loved to known 6502 assembly, but I never ended up with any
of the books or magazines that explained it. On the other hand, I was able
to take the ML-less BASIC code from computer magazines about the C=64 and
'port' them to the Atari, to play with them. (I learned a little about
AI by programming an inference engine and Dr. Eliza game.) I could also
sit down on a C=64, Apple II, or IBM PC with BASIC and crank out little
programs pretty easily. ;)
```

As crappy as BASIC is compared to most high level languages, and as slow as BASIC is on the old 8-bit systems, it really gave me a leg-up into the programming career that I've had since before I even finished college.

And like I said, TurboBASIC XL was a nice crutch later on. (Ah, finally, I can easily blit text onto a bitmap screen. ;))

Just a POV but if I imagine a world where there was only one low cost
entry level computer, whatever it was it would have been the greatest
thing since sliced bread. Doesn't matter if it was a Sinclair, Atari,
or Jupiter Ace, I would have still embraced it.

I grew up before the advent of pocket calculators and personal
computers. I still remember using slide rules and log tables when I
was taking tests in college. Even when I started work I thought a
~Wang 700 programable calculator the size of a bread box that anyone
in the building could use was an incredible tool.

Hmmm, next thing you know I'll start talking about how I walked
barefoot in the snow, uphill both ways, to school. :)

Rick

That, plus the BASIC was written in another interpreted language. TI
Extended Basic had some written in assembly, but still a lot was in GPL -
there was a GPL interpreter in ROM.

> finally, I can easily blit text onto a bitmap screen. ;))

Unfortunately my programming didn't progress much past my "Shoot the Cabbage
Patch Kid" for the CoCo (which I still have a copy of) and a rather
excellent Cricket game which was just under 16K which unfortunately has been
lost. Both were written in extended BASIC.

I really only started dabbling in ML towards the end before other
distractions came along, and then again when I got into Commodore computers
a bit later.

Last-modified: November 28, 2010

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

what a rubbish flame war, dead already...

first lets annoy ATARI and speccy owners: I agree, they are rubbish...
but then they are decades out of date.
and now for the c64 owners: The C64 is also rubbish, really, it's pants.

Now for everyone: The king of home computers is clearly the IBM PC
compatible. Sure it was more expensive back in the day, and only took
hold in the business market at first, but which machine is on
everybody's desk/lap? An IBM PC AT derivative.

:p

What happened was: I was looking for reviews on harmonicas and a web site turned up. I start reading through the reviews and I notice "This guy's really into Tequila too." Mexico too for that matter. Then I noticed he is into vintage motorcycles too, mostly British. I am mostly into Japanese bikes but I did have a 1965 BSA twin for about 15 years. That was enough to cure me => [Japanese, Husqvarna, 1966 Aermacchi/Harley].

I finally looked at the name on the web site and it was The Ian Chadwick of Mapping the Atari fame.
http://www.ianchadwick.com/index.html
Pretty nice site. I need to work on motorcycles while drinking Tequila and playing my harmonica.

Rick

Was Oregon Trail (famous in elementary school Apple II labs in the 1980s)
ever released for the Atari 8-bit? I've found some public domain 'sports'
(shooting) game with the same title, but it doesn't bear any resemblance to
the game I played on those ugly old Apple IIs.

Thanks to Kevin Savetz (who posted that he has cholera over on Facebook ;))
for reminding me of the game. (Though I also did recently see an article
about the _early_ history of the game... did you know that I did not know
that it was originally a board game? :) Is THAT what kids had to do before
there were Apple IIs infesting their schools? I'm not sure what's worse?
Hey, who threw that tomato? What's those hook for--)

I swear I can sort of remember this as a type in game in some magazine. It
was a text only game, right?

> everybody's desk/lap? An IBM PC AT derivative.

IBTD. The original IBM PC and its clone army threw back computer development for several years. These ugly, clunky, low-tech machines flooded the market and customers chose them instead of buying better, but "incompatible" systems like those great 68K and ARM based machines from the mid 1980s, e.g. in too many cases (well, the Atari ST had a strong base in the SOHO and music market in Europe and the Commodore Amiga was great for games and video/graphics - e.g. the first seasons' CGI in both Seaquest DSV and Babylon 5 were created using Amigas, but in the end both these systems were washed away by the flood of cheap IBM clones - the only survivor being the overpriced Macintosh).

Due to some good Fortune we have bought out the atari inventory of a game
store
in Southern California and we now have several 1200XL's in stock.

I have refurbished Some of them and they are ready to go out the door!!!

All Of them have had the S-Video Upgrade Installed, 800XL OS Installed for
Compatibility and Been Fully Tested.

They all come with the standard package that we always have for our systems

1 Refurbished CX40 Joystick
1 Brand New Power Supply
2 games (Pac-Man and one of your choice from the "Extras" List)
All Necessary Video Cables

Come Check them out.

=)

Well, I'm still using my "overpriced" "PC clone", a Mac mini I bought in
'06. Runs as good today as it did back then, and has outlasted many other
computers I've had. Only my Gateway in 2001 lasted 5 years, but it had gone
through several hard drives, several reinstalls of the OS, a processor
upgrade and was way too slow at the end (like having Abe Lincoln's hammer,
having replaced the head twice and the handle 5 times).

So for me, it was worth the $$$.

My long-time Atarian buddy Ben Corr is busy until May, and asked
if I could put off the Atari Party.

My wife also wanted me to avoid too many distractions until
tax season was over. :)

I was asked to avoid conflicting with Pin-A-Go-Go, which is why
I specifically didn't do the weekend of May 14th.

Nope, that's not it. Looks like it was never ported to the Atari 8-bit,
which seems a shame! :^(

http://en.wikipedia.org/wiki/The_Oregon_Trail_(video_game)

"The Oregon Trail is an educational computer game developed by Don
Rawitsch, Bill Heinemann, and Paul Dillenberger in 1971 and produced
by MECC in 1974. The game was designed to teach school children about
the realities of 19th century pioneer life on the Oregon Trail. ..."

"The Oregon Trail was created in 1971 by three student teachers at
Carleton College in Northfield, Minnesota,[1] using a mainframe
computer. ..."

"In 1978 MECC began encouraging its schools to adopt the Apple II
microcomputer. The first Apple II version of The Oregon Trail was
an Integer BASIC type-in adaptation in Creative Computing's May-June
1978 issue. The program was adapted by John Cook and provided on
A.P.P.L.E.'s PDS Disk series #108. A further version called Oregon
Trail 2 was adapted in June, 1978 by J.P. O'Malley. The game was
further released as part of MECC's Elementary series, on Elementary
Volume 6 in 1980. The game was titled simply Oregon, and featured
minimal graphics. It proved so popular that it was re-released as a
standalone game, with substantially improved graphics, in 1985."

Edition-wise, it lists:

1981 to 1985 The Oregon Trail (Apple II).
1992 The Oregon Trail Deluxe (MS-DOS).
1993-96 The Oregon Trail Ver 1.2 (Windows).
...etc.
The Oregon Trail for Facebook

So it looks like I played the improved-graphics version made
for the Apple II in 1985. (At which point it would've been
brand-new, since I was in 4th & 5th grade that year.)

Time for someone to do an Atari 8-bit conversion! ;)

I forget if I asked this, but I was pondering Driving Controllers
(CX20-01, used with Indy 500 on the Atari 2600) yesterday, since
I found a fun Tempest 2000 clone for Linux (and Windows) called
"Typhoon 2001". I think it'd be cool to hook a Driving Ctrl'r
to Stelladapter. :)

Are there any existing games for the 8-bits?

PS - Kjmann - Tempest Xtreme needs Driving Controller support! ;)

I'm doing my Atari Party in Davis in May. I'll be showcasing
a few games. (How? Could range from 'games that get to go
up on the projector', to 'games that get mentioned specifically
on website or flyers', or 'games whose histories get posted
as educational info shseets').

What titles would be good? I post a list of what I'm thinking of,
but it'd be off the top of my head (since I'm busy),
it'd be be pretty limited (since it'll be from what I own,
or are shareware or public domain), and I don't want to influence
the answers. :)

PS - (Spoiler!) This looks like a good starting point:

Using the Atarimania top 25 titles:

Rescue on Fractalus has an interesting background story as well as being one of the greatest titles for the system (both technically and in terms of gameplay). M.U.L.E. (one of the first titles by EA and one of the greatest games ever on any system) is also worth mentioning, as is Star Raiders as the system selling title esp. for the 400.

Encounter!, Dropzone, Capture the Flag, Mercenary and Schreckenstein are technically advanced and display the hardware capabilities (split screen, scrolling, colour rwegister changes between screen lines) and the fast CPU very well.

Landon Dyer's version of Donkey Kong has a very interesting background story (as well as being the first home version featuring all four screens) - check his blog.

I'd pick a modern homebrew title also (Yoomp! from that Atarimania top 25 list is a great candidate).

Thorsten

> Sorry, There is no more Room on the cart for the routine. =)

Heh, was a routine ever coded / experimented with? I imagine it would've
been more of a timing issue than a space issue.

I'd give up another feature in return for a rotary controller option,
but then I'm probably one of VERY few people who have those kinds of
controllers. :^/

I started watching D.A.R.Y.L. a few nights ago (haven't had time to finish yet). I was pleased to see a scene featuring the playing of Pole Position on what looked like maybe an 800XL or 1200XL.

I will have The Completed "Space Harrier" With me by that time, as well as "Dr.Mario", "Donkey Kong - Arcade", and the New "Pitfall II" with the new game save to cart system built in.

Also, if it's Ready to be shown, I will have the new "Jungle King - Arcade" to show off. it's complete with more authentic arcade sounds and the background music that was missing in the atari "Jungle Hunt". we have also changed the main character to the Tarzan type guy complete with the Tarzan Yell. All Just like the Arcade version of "Jungle King"

Cool, is that game finally finished yet? :) I've played a couple of the demo releases, and showed them off at the past Atari Parties.

> as well as "Dr.Mario",

I tried this, and it was a fair conversion, but had a few annoyances that I talked about here a while back. (Esp. the whole-game-freeze that happened in 2-player mode...)

> "Donkey Kong - Arcade"

What's the story with "Donkey Kong - Arcade?" I have the original 400/800 DK cartridge, and it didn't seem like a very good conversion (not that I've played others... maybe Colecovision version, decades ago.)

I didn't appreciate the Apple II-like artifacts when objects went through each other (XOR'ing, I guess?) :)

Yeah, even I'll admit that that one was a stretch. I was going for the white part of the XL matching the usual color of the dress and appliances, but it didn't really work.

So here's something I didn't expect to find on Amazon instead: http://www.amazon.com/Atari-1010-Program-Recorder/dp/B001VO7WDC .

Cassette lore: I remember one of the criteria for what was a serious or modern computer was: If it ever had a cassette interface it couldn't be modern. By that definition the IBM PC which came stock with a cassette interface was classified as previous generation.

I loved my Atari cassette! My first was one of the GE types but I picked up a bunch of 1010s after that. I was doing a lot of programing for other people which meant me doing M/L programs for them to call from BASIC mostly. I must of stepped on DOS a 1000 times rendering it incapable of saving my work. Heck, couldn't even load a utility to step through memory.

Before I got Omnimon and developed better programming practices, like save before you run or compile, the cassettes saved my bacon dozens of times. I can remember getting in arguments with ROM vs. loadable binary for DOS mainly on my experience with how when everything else went south on an Atari you could always count on the ROM cassette routines to still be there after an errant pointer.

Just my op but every computer should have a routine in ROM that is bullet proof. Just something that comes in maybe as an interrupt and watches for a key combination. It would only need to be big enough to write out a memory snap shot so you could figure out what happened.

Rick

<http://www.dadhacker.com/blog/?s=donkey+kong>

"Donkey Kong and Me" is the most interesting article.

Thorsten

BTW: Does anyone know whether the Atari software used for the computers
inside the space station in "Enemy Mine" is available anywhere? IIRC
Christoph Schulte-Vennbur wrote at least one of these.

Most of the case was white. Only the keyboard portion was black.

No but my crutch was typical of the adding 2+2 in a way to blunder the answer 5 and putting in a decrement routine i.e. "IF RESULT=5 THEN RESULT==RESULT-1" kind of style.<grin>

I used to have a lot of goofy cassette routines for manipulating dumps. I seem to recall doing stuff like holding down reset and plugging in an ASM/ED cart to look for what was lost, loading files from cassette into Speedscript and saving them to disk. Sheesh! Just so much simpler to save every so often. I don't know what I was thinking.

We also had IMNSHO a lot of bad advice back then. For instance: Use a ram disk to save your source code because "Compiles/assembly from ram disk are lightning fast!" Yeah right, and so were unrecoverable crashes! I do recall figuring that one out the first night I had my Rambo plugged in.

The trial by fire actually helped. It encouraged me to write better code with comments and formatting such that the code could be understood at least by myself. The slow assed Atari I/O taught me to stop assembling after every PLA or DEX so I actually developed a little more complete of a subroutine or function concept before each compile.

Heck, I'm probably too old to program now. Firmly in the [loose shoes, grandchildren] faze. The grandkids would much rather I tickle them then my Atari keyboard.

Rick

I will also admit to this, and even went so far as to keep copies of
them from multiple versions of DOS.

Except for DOS3, which just flat-out blew chunks.

I will have to admit now that I sold out all of my Atari
gear in the late 1980's, and have been trying to recoup
some of it over the past 10 years. I will never be able
to recoup it all as I had over a dozen computer systems
and more than half/dozen video game systems, as well.

BTW, that reminds me, the Atari OS _itself_ included things like
line drawing routines, trigonometric functions, and even an admittedly
odd, kind of hard-to-use flood fill routine.

So really, BASIC just happened to make these routines available using simple
BASIC commands (PLOT, DRAWTO, COS(), SIN(), etc.), but it was, I imagine,
trivial for other languages or straight machine-language games & apps to
utilize them.

Atari BASIC's:

10 GRAPHICS 7:COLOR 1:PLOT 0,0:DRAWTO 159,95

and Action!'s:

Proc Main()
Graphics(7)
Color(1)
Plot(0,0)
Drawto(159,95)
Return

are both just wrappers to the OS routines. Things like the OS's
"S:" (screen), "E:" (editor) and "P:" (printer) device were nice
abstractions.

You can "LIST" your program source in BASIC to the screen, but you
could also do 'LIST "D:SOURCE.LST"' to save the BASIC program as
plain-text (not tokenized, like when you do 'SAVE "D:PROGRAM.BAS"'),
or 'LIST "P:"' to print your BASIC source out to the printer.

Under DOSes, you could, for example, copy "D:MEMO.TXT" to "S:" to view
it on the screen, or to "P:" to get a hard copy. And since additional
devices could be added to the OS ("D:" driver is usually bootloaded off
of a boot disk, though there were cartridges like SpartaDOS, too), 3rd
parties could invent new devices that could be talked to using the
standard I/O functions (e.g., what BASIC provided via wrappers:
"OPEN", "GET", "PUT", "PRINT", "INPUT", "CLOSE", "LOAD", "SAVE",
```

"ENTER", "LIST", "NOTE", "POINT" and "XIO"). The "R-Time 8" battery-backed-up realtime clock cartridge was an example... or special printer drivers.

Ugh, I'm reminiscing & bragging too much. :) Basically, Atari's device abstractions are cool, and it's kind of the same way in Linux with /dev, /proc, etc. :)

Probably - even the TI-99 had abstractions - everything was treated as a file. You open a file to disk devices, serial ports, parallel ports, everything is communicated to by records. Even the screen and keyboard was treated as a file in BASIC (but this was only in BASIC).

Devices were easily added using Device Service Routines (DSR's) in add-on cards or command modules (cartridges in TI-speak). Subprograms could be added similarly. The CALL FILES routine, for specifying # of open files allowed at once, was a subprogram in the disk controller card, for example.

The ROM/GROM had trig routines, floating point math, cassette I/O, keyboard scan (with support for multiple mappings, including "split keyboard" for games), an interrupt-driven sound list routine, an interrupt-driven sprite movement routine, and tucked in the ROM was a subroutine that moved a small assembly program to hi-speed RAM that rotated characters around the y-axis... always thought that was weird.

LIST could write to the screen, to a device (printer, disk), even to a DSR added by the TE-II cartridge - so you could do a LIST "SPEECH" and have it speak your program to you...

Oddly enough, that was actually how I got mine. More accurately, my parents sat in on the timeshare presentation to get the computer but never actually bought into the timeshare.

Thankfully, they subsequently realised their mistake and I ended up with an 800XL 18 months or so later. About the best thing the Aquarius was capable of was using FOR/NEXT loops to bog down the CPU in such a way that the RFI with an AM radio placed next to the computer would make 'music'.

Yes, I remember the ad for the 'free computer'. I asked my parents to
go, but they somehow found out it was a gimmick for the timeshare...

Another good one was a promotion Texas Instruments did where you'd get
a free TI-99 if you bought carpet and had it installed...

Cool! I know practically nothing about the TI-99, so that was
fascinating.

IIRC, much of this could also be done with Atari Basic using the OPEN
command. It's been a *long* time since I've used it, but my
recollection is that devices other than disks, cassette drives,
printers, etc. could be accessed that way. I don't believe it applied
to audio, though; that could only be done via the SOUND command.

There's still a VIC-20 at my parents' house that we got from attending a timeshare. We already have a C-64 at the time, so while we did plug it into a TV and play with it a bit, I doubt it was used for more than 10 hours in its entire life.

My mother came to actually start enjoying dickering with the timeshare salesmen -- she must have gone to at least a half-dozen of them, collecting those 5" black & white TVs that were also a popular giveaway, a cheezy "boat" (rubber raft with a small electric trolling motor), the VIC-20, and a few other things.

The C64 has a similar facility. One usually accesses tape, IEC bus devices
(disk, printer, some memory card devices), and Expansion Port storage devices
through BASIC's I/O normal commands. The stock RS232 code works that way
too, though few use it anymore. I seem to remember that the screen and
keyboard are accessible through that method also, though obviously most would
rather use the regular non-file PRINT/INPUT/GET commands.

It opens/closes files and does I/O in a pretty common way, and has the "CMD"
command to redirect LIST, PRINT, etc. to a stream (as long as it has already
been opened for writing).

> Which most people didn't, just having cassette tape. But loading 48K in

> bytes somewhere, and they'd fit into the system fine.

Vectors are provided in the C64's "system" RAM area to allow supplemental
drivers and command extensions to insert themselves in ahead of the stock
Kernel or BASIC code. The 1541 drive came with such a driver on disk that
one could load, which added a set of drive command shortcuts, the so-called
"DOS Wedge". The 17xx RAM Expansion Units came with a similar driver that
would set those devices up as RAM disks, in addition to adding the
aforementioned shortcuts.

4522. Anyone heard of a Centurian Enterprises 5 1/4 disk drive for an Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2011-02-18 20:45:35 UTC
From: Robby
Message-ID: <bjmtl6pl990ep9j8h7pk8ju7hll2dc3tkg@4ax.com>
Source record: 761

A friend has some Atari related hardware, and while I know little to nothing about them, I offered to see if I can find out anything for him. Also if this stuff is of interest to anyone, or should he just strip them for parts - something he doesn't want to do if they can be used as designed.

Okay, he has 4 - 5 1/4 floppy drives. There are no model/SN stickers on any of them, but they are labeled "Centurian Enterprises" over the disk slot, and "Limited Edition" below it. They have a pair of 13 pin Atari peripheral connectors on the rear panel that match a connector type I've seen on his Atari 130XE.

Sorry I don't know more about them. He has other stuff, but he hasn't given me a list yet of what he has. I know there looks like quite a bit of stuff related to 400's, 800's and who knows what else. Should I bother posting about them after I get the information, or is there no interest?

Thanks for your time and patience,
Robby
(an old ZX81 and TI99/4A user)

Given the Centurians were the ~elite guards of Rome the drives were
probably part of a commercial disk duplicating system. *IF* this is
right then they will probably function as at least SSSD Atari disk.
You can't tell much else w/o doing some detective work. You can use
something like MyDOS to try different configuration to see what they
will accept as a configuration block and if they can format a disk in
that mode.

You can can also get some of this by popping the hood. i.e. If the
contoller is a 1793 then it is single density, a 2793 or 2797 implies
double density. Likewise any ram chip greater then 128 bytes implies
extra functionality.

If the processor is a 6502 or derivative and you can do a ROM dump it
may be easy to tell what if any the extra commands are. IIRC most
commands are in a single block.

Rick

It sounds a little like the first disk drive we got, but it says
something like "San Jose Special Edition." It is basically an 810 drive
in a metal case with the Archiver chip added.

I'd probably be interested in at least one if the price is right and
he's just going to strip them for parts otherwise.

- Trevor

4530. New vendor for the vendor list ?

Newsgroup: comp.sys.atari.8bit
Date: 2011-02-25 04:29:53 UTC
From: russg <russgilb@sbcglobal.net>
Message-ID: <ea31dafa-4f6d-4e84-8002-03ddd3945cdd@u6g2000vbh.googlegroups.com>
Source record: 769

I'm pretty sure M. Current reads c.s.a.8.
I found a new vendor while searching for a new RF switch for my 800XL.
Those switches are probably available at B&C and/or Best, maybe.
Here's the URL.

http://estoreoutwest.com/index.php?main_page=product_info&products_id=1456

Wow - they've got Combat in the box for $7.50! :)

Seriously though, it looks like a good source for parts. Too bad the
board-mounted I/O connectors are out of stock.

- Trevor

Hi alll,

maybe some of you know me and other maybe not ;-)

I want te say Hello.....

from amsterdam, the netherl;ands......

And yes it Sysop Bernard of Becotel BBS.... from years a go ;-)

Yep i'm still a live and kicking ;-)

See you maybe soon.....well how soon i don't know.....

Gtx. Sysop Bernard

4534. Rainy Boring Sunday so...

I think I have had about 5 computers in the last 4 months. 3/5ths my fault trying to run 10 year old equipment but I don't take credit for having my Thinkpad stolen out of my truck last month or my netbook being tossed off my boat into SF Bay. Back to semi current system with XP but still old enough to have a serial port Dell 600m. Exact same model as bit the dust on me last year so I had to have it cause I have a drawer full of spares like CDROM drives and PS.

Fooling around running Atari800Win Plus 4.0 I check artifacting and I seem to recall I could get this to work in Gr.0 and look just as good as Gr.12. No big thing but gives me an excuse to see how bad the newsgroup tosser will truncate and butcher stuff.

Ha ha ha ha. Alrighty. Gotta delete the auto-wrap of the DATA so
that the numbers come on same line as DATA,
like change:

275 DATA
255,255,255,255,etc

to

275 DATA 255,255,255,etc.
Then translate to ATASCII.

just takes one DELETE and one SPACE on each line where DATA is on a
separate line.

A nice surprise.

Cute.

I tried it in GR.0 with artifacting. Picture is still recognizable
but sort of inversed video.

I'll give it another look on a real Atari. I seem to remember being able to set color registers such that I got a 4 color artifact mode similar to Ultima III but brain cells are not quite firing after such a long layoff. Refesh wasn't active!<grin>

It could have been something else like I modified a GR. 0 display list to use ANTIC mode 4 and that is where I am getting the mode 0 from.

This was from back in my days before I moved to the internet. On CIS in the mid 80s I had gotten in debates with people using bitmap modes over going with Atari's strength of redefined character sets. I made the statement "pixels and colors in Gr. 15 were identical to GR. 12 " and Bob Puff chimed in ~You're wrong, you don't know what you are talking about. So I wrote an Action! program to convert GR 15 bitmaps to the fewest possible characters. It would search through the character set to make sure a pattern wasn't already defined before adding it and keep a list of what went where on the screen.

It wasn't really useful other then proving my point. The complexity of the picture was really limited before you have to start using multiple character sets, I barely got Mickey in one set. But resulting picture and screen map only required 1800 bytes for storage w/o compression. Funny thing is if you put the original 7,680 byte bit mapped mode or the 1,800 byte character mode through arc or zip they end up about the same size. I looked briefly at Graphics to Font and the author seems to have defaulted to adding however many character sets it takes. It's probably the right approach.

Russ, I fooled around a little more with uploading. At least for using the google reader it doesn't break lines with no spaces. Something like
10DATA200,232,234,...
appears as one line. I fed a line created like that into Atari BASIC on the emulator and it expanded it just fine. I *know* I am beating a dead horse but every once in a while I think it would be useful to exchange files/programs/binaries in the newsgroup.
I had started doing a conversion of Pools of Radiance graphics to Atari fonts when my laptop got stolen. I was doing Dungeon Master graphics when my previous laptop bit the dust. Everything sucked bananas of course on the 8 bit.I'm trying to find meaning in random

events! Like the Gods of the Screaming Electron are trying to give me a message I can't decipher.<grin> Well, once more into the fray. I think the message may be ~start over from scratch instead of hitching my wagon to someone's elses horse.

Rick

4544. where to upload file

Hi everybody!

I was just wondering where would be the best place to upload files that I would like to share.
I have a few ATR files of programs I made, such as an Atari port of the Apple II's Lemonade Stand.
There are also some jpeg wallpapers I did of Atari screens, complete with scanline and phosphor-dot effects.

Stan,
Atari user since 1986

Hi!

You should and could send it to www.atarimania.com and
http://atari.fandal.cz/ and maybe even me : http://pokeysoft.no/games/

Take Atarian care

4550. Re: where to upload file

Newsgroup: comp.sys.atari.8bit
Date: 2011-03-18 06:36:05 UTC
From: Stanley Hunt <stanley_hunt@shawRemoveThis.ca>
Message-ID: <q3Dgp.3530$bd5.3151@newsfe02.iad>
Source record: 789

Minor correction:
Wallpapers are png files, not jpegs.

I also zipped 104 gifs (400x240 each) as an index of the actual wallpapers.
The wallpapers were made from enlarging them 4x5 times:
1600x1200 including Atari border
1280x960 inside border (320x192 Atari pixels)

4554. Re: New group for female ATARI programmers - "ATARI Girls"

Newsgroup: comp.sys.atari.8bit
Date: 2011-03-22 19:11:02 UTC
From: Hannah Fontana <hannahfontana69@gmail.com>
Message-ID: <91947a32-23c7-409d-8085-0d51c4b90cdc@glegroupsg2000goo.googlegroups.com>
Source record: 793

The Atari community is so small that it doesn't make any sense to target only women (or gays like another poster wanted to do for the Commodore 64).

Seriously, how many active Atari programmers are there left? Maybe 50? That's probably stretching it.

When was the last "major" piece of software released for the Atari? I'm guessing at LEAST 20 years ago.

Way off - new stuff is released for the 8bit and 16/32 bit machines quite
often.

Perhaps you should actually research before posting (in other words,
engage brain before engaging mouth)? :)

Hmmm... I agree, but while a person could convert the graphics and text
with little problem, I would want the mechanics of the game somehow.

Anyone disassemble this game yet? I have heard a lot about it though
never played it.

Well, I would love to see what the "ATARI Girls" come up with.
WARLORDS for the 2600 was written by Carla Meninsky and that is my
favorite game on the 2600. (4 players is just fun and vicious!)

As for major releases lately? I am more of a hardware and telecom guy
myself and happen to like the older games. But of the newer stuff I
think there have been cool developments in term programs, Contiki
(telnet, FTP, etc). The IRC chat program. Various emulators that run
ON the Atari computer (like the Apple 2 emulator!) It seems like every
week on Atariage something new is being released.

Not exactly at least for some of them. It is much more convenient for everyone involved, and cheaper too, to have the BBS available through telenet. Steve Tucker has it integrated into APE so your PC does all the work and the Atari end thinks it is hooked up to a RS232 type modem. Instead of dialing from the command. If I have it right instead of
ATDT 555-1212<hit return>
you just
telnet://rdfig.net<hit return>

The experience for me was almost like a time machine. You start remembering control sequences and posts you made more then two decades ago. I would still like to see the space shuttle graphic from Itsy Bitsy taking off one more time.

Rick

PS: A quote from Jeff Bell, Itsy Bitsy SYOP back in the day. Times have changed.

"I named my BBS 'Itsy Bitsy' because I wanted people to know that it's not a big system with main frames or 30 MB hard drives. It started as a one-drive system that was itsy and had lots of bitsies."

There are about 30-40 dialup BBSs in existence.

None are run on Ataris at this time.

However the Prison Board at least has a way to be dialed in and gives a
TELNET out point to the current Atari BBSs out there.

Please help spread the word! The 3rd annual "Atari Party" in Davis, California has been scheduled for Saturday, June 11th, 2011, from 12pm-5pm.

http://www.newbreedsoftware.com/atariparty/2011/

Join other Atarians and the curious/nostalgic public for a day of video games on a variety of Atari systems: Pong, 2600, 5200, 7800, 400/800/XL/XE, ST/TT, Lynx and Jaguar, plus emulated arcade games on GameBoy Advance & PlayStation2.

We'll also be screening the documentary file "Once Upon Atari" during the event, and the 1984 spy-thriller-with-Atari-game "Cloak & Dagger" at the end of the event.

Finally, there'll be a free prize give-away where you could win anything from Atari-themed t-shirts and playing cards to actual Atari systems!

This event is completely free, and open to the public. (This includesd the movies and prize give-away! Yes: just show up, and you may walk away with an Atari 1200XL or Flashback 2+!)

Davis is located just west of Sacramento, along Interstate 80; about 1hr east of San Francisco.

Cheers to that!! :) What was it to you that made the keyboard the
best overall?

For the Atari 800 keyboard I think it was the response to the typing.
Not only the key click sound, but the physical response to the typing as
well. Granted, I have the type of keyboard on the 800 that when I type
at 60+ WPM an occasional key wants to go flying.

Also I think my 800 keyboard used to be more responsive, though these
days some keys take more work than others. :)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Is the Delta Drawing manual online anywhere? I seem to have misplaced mine.
(MIGHT be buried in a box, but might be lost forever :^/)

Part of the reason is because over a year ago I started work on a
modern clone of the program, and want to make sure I'm not missing any
obivous features or UI concerns...

If I have it right all 800 keyboards actually had metal contacts. When you pushed a key in the plastic piece holding them apart would get out of the way, allowing contact. Really nice IMHO too. No clicks but reliable and ~3/4 of what is considered a full movement keyboard.

1200XL was also 3/4 movement but the first to use goofy contact mylar sheets. Damn fine keyboard with springs and good wrist angle so not a lot of carpel tunnel syndrome.

800XL reputed to have been made by 3 manufacturers, all of them bad. The contacts don't seem as bad when it comes to corrosion compared to the 1200XL but still less then perfect. It's only a 1/2 stroke keyboard which is OK but I'm a bit old school.

XE series, rubber pads that made contact and acted as a spring. I didn't like my ST keyboard with the same feel. They are OK compared to the junk coming out for the PC of late.

My favorite keyboard of all time would be the IBM PC AT, I finally ran out of them though. Click, springs, and full stroke. I preferred it to even the defacto standards like IBM Selectic typewriter. I still have all kinds of dongles so I could plug them into PS3 type din

connectors.

Rick

Rick sums up why the 1200XL keyboard is good, in far more technical
detail than I ever could.

Though I do also remember laughing at a Computer Chronicle episode where
Apple or someone was showing off these fancy 'new' "wrist-rests" below
the keyboard.

I stared at my TV, then looked down at my 1200XL, and was like: "so? I've
had that for years!"

And yeah, my laptop PC is not only very flat, very soft, very typo-prone keys,
but it's at a completely flat angle.

Amen, Rick! I've got 2, one on my son's comp, and one on mine, with a couple of "spares". SysAdmin at a local library helped me stock up a bit on spares for them, so we're good for awhile yet.. Love going clackety-clack, and really dread the day I'm forced to use a "modern" keyboard.

These keyboards are so good (and heavy, tank-like even) that they make me want to open up a Konsole on my Linux box and go command line. :)

I see HxC floppy drive works with Atari ST, Amiga, PC, etc... I am
wondering if the drive works with Atari 8bit, Atari XF551 has the 3.5
PC drive with Bob Woolley's ROM. Does it work ?

4599. EPROM programmer

Source record: 938
Body handling: HTML body converted to readable text

After a 15 year layoff I finally burned an EPROM again. It's been trying, had 30 gigs of development software including stuff for my Needham when it crashed and burned.

Bought one of those cheapo USB programmers off FleaBay. Turns out my UV erasure still works but only had two EPROMs left after the deluge. One programmed fine, the other gets about 1/4 way through and bails out. First thing I programmed was ED/ASM revision B. Back when San Jose Computers was still in business they had ED/ASM revision B carts for $20 and populated board revision A carts for $5. You can guess the way I went. Long time to upgrade.

I know, I should be using flash rams. I will switch. I have been fooling with GAL chips too. I think the older I get the dumber I get because I a really having trouble wading in. Took several hour just to get an example compiled, then I had trouble with the simulator! I know I'm the problem, not the software.

I have to make sure that 5200 is running. Seems like it would be a good platform to make a one off 8 bit with 32k of cart space.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

I've been doing a lot of retro the last 2 months. Only about a third of it is Atari because I have been jerking around with things like Warcraft Orcs vs. Humans. I saw one of those WinCE laptops at Walgreens for $99 and managed to escape w/o buying it. The CE emulator sucks.

I saw they had a Sega Genesis emulator for $20 too. Motion sensing joysticks and SD card interface. Things are looking up, IIRC the Sega was just a bit stronger then an ST with respect to colors and built in graphics chip. I tired of writing software for my hand held NES emulator after getting a simple cart image to run. I wish the market would settle down to a single platform so people could get busy with it.

I was looking at 'modern' storage solutions for the 8 bit and while they are functional I think they may have missed a certain market segment i.e. Cheap like me! No way I am going to spend a hundred bucks for a hardware solution that doesn't do much beyond what you get with SIO2PC.

What should'a had'a happened is instead of using PORT B bits for bank switching someone should have built a bit banging SD card interface. I think the only thing you would need is a 3.3V regulator and an SD socket. It would be slow, probably no faster then a real disk drive, but being flash it would be just as secure. For that matter you could hang one on a joystick port.

Sold as a single lot on the dominant auction website, you might get
$90 for it. A little more depending on cosmetics and how much RAM is
in the 800.

Piece it out and list it one-by-one you'd get somewhat more I think,
but it'll be more work to do the individual photos and listings.

There's a sales website ecrater DOT com that I sort of like. You can
list the stuff there and let it sit until it sells. But it'll take
longer, maybe a lot longer. Some of it'll sit there indefinitely
because ecrater doesn't bring the buyers like the other site does.

What's the warning regarding the 410?

4609. On Super Breakout

Newsgroup: comp.sys.atari.8bit
Date: 2011-04-24 13:24:12 UTC
From: Tin Lunchbox <no@spam.thx>
Message-ID: <r668r69q44afb1smnmvaubrr4bh5brcp5l@4ax.com>
Source record: 948

We were discussing the colored-brick-busting-w.-pong-paddle Breakout games on an IRC channel yesterday.

I am of the opinion that more angles should be available. When your paddle can only rebound the ball at four angles I think it diminishes the play value. You can also find yourself unable to hit the brick you want. I would like to see Breakout with six rebound angles, and maybe a straight-vertical as well, which would be seven angles.

I don't think I've ever owned Super Breakout for the 8bit. I watched some videos of it, and it looks just okay. It looks kind of uninspired with the blocky text, but it does get the colored separated bricks right. The playfield takes up about 3/5 of the screen. It's not as large as it could be. I'd like to see the full-screen used. I think a game can have its dimensions adjusted for the screen it's on, and still be true to the arcade. Does anyone know if Super Breakout for the 8bit has additional-balls-in-cavities and advancing-walls modes?

I recall the standard Breakout and the later Super Breakout for the Atari 2600. The standard one had good play value like most of the early 2600 games. Sears called it "Breakaway IV." It didn't have the cavities or advancing walls features. It had artificial characteristic of the sixth rebound sending off the ball at a sharp angle no matter how you hit it. It used almost the entire screen, which is a good thing in my opinion. Now Super Breakout for the 2600 was a stylish affair. It looked and sounded good, and had the advancing walls and IIRC the cavities. The sounds were chime-like, metallic yet melodic. However there were only the four angles. It did not have separated bricks, i.e. it displayed the walls as ribbons until you started picking off bricks. It's not quite like the arcade, the colors are also different, but nevertheless it is a memorable and very good Breakout variant.

The 5200 version, based on a video I watched, has the cavities and looks slightly better than the 8bit version. It has an unnecessary "dissolve" effect for each busted brick. The 5200 version is utterly impaired though, because it must be played with the joystick (or possibly the trackball, the video said). Breakout in my opinion must be played with a paddle controller.

There was also Arkanoid for the XL/XE. That's sort of a Breakout-like game with power-ups and much more advanced graphics. It adds so much stuff and is different enough in style that I do not consider it a Breakout game in the sense of the ones I discussed above. However it is good and quite advanced in its own right.

What then would the ideal Super Breakout be? In my opinion, it would take up the entire screen, have options for advancing walls and additional balls in cavities, have the authentic arcade color schemes and separated bricks, and last but not least have more rebound angles for depth of gameplay. I would also not object to an option for the charming chimes sounds of 2600 Super Breakout.

I remember paperweight!

Back when I was in High School, we had just gotten in some new 800XL machines and I ran paperweight on them in front of the "computer admin."

His reaction was priceless, yet he trusted me not to have destroyed the equipment.

Ah.. that brings back memories.

We had some educational software *on cassette* for the Atari and I remember that with a single POKE you could activate the 410's motor and just let the speech play through, while you were secretly playing.

There was at least one and maybe two replacement 400 keyboards; one was the
BKey or a
name very similar..

Yes there was. They weren't on the market for long, IIRC. I can't
remember who made them or their approximate cost, either.

I see the cart games alone are going for at least $10 each. I offered the person $50 total which includes UPS shipping and he accepted. I think I got a good deal. He was trying to sell the lot for $20 locally and no takers. I was surprised.

You could also rewire a standard keyboard for it. I recall my dad doing
that with ours.

A. G. Lisi's E8 model may be showing us what both our space & time really are.

(Click link below.)

http://www.amperefitz.com/e8.htm

Crystals and chemical compounds are tied up with group theory which best explains (mathematically) exactly why they form the particular way they do.

Lisi's E8 model is a group theory model that may be showing us why our space forms the way it does via frequencies that cannot be directly measured from inside of our particular space-time realm (Wheeler - Feynman).

In UKP they would have been close to £100. I remember thinking they were
too expensive. OTOH, I had an 800 so I wasn't too worried. :-)

4627. Something for 16k MS BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2011-05-09 20:17:46 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <72f8c03a-7e19-4d4d-b0f3-db6cd218a659@35g2000prp.googlegroups.com>
Source record: 716

I was fooling around looking for some docs on my Jupiter Ace and came across a listing for and Adventure game. IIRC the author had hacked MS BASIC to run on his terminal based SBC. I tried it with the Atari800 emulator using MS 16k ROM image and it seems to run just fine w/o modification.

```
1 REM *** Discovered circa 1980 on a Commodore PET
3 REM *** at Hereford Technical College
4 REM *** Resurrected & bugfixed By Jon Bradbury / micro_brain
5 REM *** from a yellowing 31 year old dot matrix printout
6 REM *** http://forum.6502.org
7 REM *** For UK101 8k BASIC, 71 character lines but should work on
all.

Nice work but I think something went wrong with converting the listing.
Like on this line:
460 FOR J=1 TO X:Z$=CHR$(RND(1)*15):W$(X)=W$(X)$:NEXT J,X
Do you still have the original? I like to try it out too.

Later, Katzy.

I pasted this into AppleWIN with the IIe ROM, and it runs fine
but with a few things that don't compute. For example, if I just
make a move in the beginning, it tells me that I left the cave
without any coins, and lists a bunch of stuff that was available.

If I attempt to TAKE anything on the list, it says ?nothing here?.

Perhaps there are instructions somewhere that help you play?

Bill

The author is still active. You can reach him/reply to his thread
here.

http://forum.6502.org/viewtopic.php?t=1819

He just did a name change

http://forum.6502.org/viewtopic.php?p=14483&highlight=#14483

BUT it could be a problem with the MS BASIC version you are using.
I'm not up on all the versions, the one I am using is labeled
MicrosoftBASIC2.bin created 2001 and is a 16k image. I can't remember
where I got it from. You may be able to use the 8k Microsoft BASIC
with the disk based extensions but I haven't tried it yet.

If you need the 16k version of MS BASIC let me know. I can UUENCODE it
or maybe put it up for ftp somewhere.

Rick

No instructions but I think 1st move is always DOWN to enter.

If you are still having trouble you could maybe add

735 PRINT Z$ REM DEBUG MOVE

in the following section.

710 REM INPUT MOVE
720 INPUT "Move :";Y$:Z$=LEFT$(Y$,1)
730 J1=0:K1=0:L1=0
740 IF Z$="D" OR Z$="d" THEN L1=1
750 IF Z$="U" OR Z$="u" THEN L1=-1
760 IF Z$="N" OR Z$="n" THEN J1=1
770 IF Z$="S" OR Z$="s" THEN J1=-1
```

```
780 IF Z$="E" OR Z$="e" THEN K1=1
790 IF Z$="W" OR Z$="w" THEN K1=-1
795 IF (Z$="L" OR Z$="l") AND L=-1 THEN 490
796 IF (Z$="L" OR Z$="l") THEN 870
797 IF Z$="Q" OR Z$="q" THEN 1440
```

Rick

Thanks Rick, that helps lots. There are a few string errors in
the later sections, but I can fix those. I'm just surprised that
it works at all in the Apple IIe version of BASIC, usually known
as Applesoft II. It was written by MS back in the early 80's, or
even earlier. Thanks again.

Bill

If you need the 16k version of MS BASIC let me know. I can UUENCODE it
or maybe put it up for ftp somewhere.

Rick

When you want you can ftp it anonymous:

ftp.nostalgia8.nl

Thanks.

Later, Katzy.

OK, I *THINK* I did it right. It will be in your upload directory.
Shows as 16,384 bytes so it should be good. Let me know if you have
trouble with the ROM image and I will give it another shot.

Rick

Got it and am going to try to use it. In between I found a way to play the
game as it is, with FirstBasic for DOS, which you can download at
ProgrammersHeaven.

It looks like this:

A doorway opens north.
A doorway opens west.
There are 100 silver coins here.
A nasty little gnome bars your way!
Move :? t
The gnome won't let you have it!
Move :? f
The gnome is dead!
Your vitality is reduced to 19
Move :? t
You now have:
.. 100 coins.
Move :? q
You have left the cave area with 100 coins.
You missed the doubloons
You missed the dollars
You missed the sovereigns
You missed the pieces of eight
You missed the byzantine coins
You missed the gold pieces
You missed the treasure coins

Your score is 630

@Bill. You have to find your way in the cave, collecting treasure and fighting
the monsters. Besides the normal commands for the several directions you can
use L for Look.

Later, Katzy.

Ah, thank you so much. Not being an adventure gamer,
I always forget to 'L'ook or check inventory. Have
you happened to find a command for that one? :)

Me thinks in the best tradition of BASIC hacks this program the very definition of spaghetti code. Only one GOSUB in the entire program, everything else is a GOTO. Even for BASIC it is pretty bad. IMHO it was at least partially due to the platform and the times. I think a Commodore PET had a maximum of 32k memory<?>. It's been ~30 years since I last fooled around with one. People were always trying to save a byte or two by using one letter variable names like I$ instead of INVENTORY$.

That being said, when you get all the treasure on a level the program lets you know so you can start looking for a way to go deeper. In the finest traditions of the day, you are expected to map out the dungeon on paper with all the locations labeled so you can get a strategy going: Get the heal potion before the big fight for instance. I used to have literally reams of paper from taking notes and making maps for RPGs and Adventures of the day. Soon as auto-mapping became the norm so they would appeal to lessor geeks I left all that behind.

Rick

In textadventure games it is I of Inv or Inventory. This one has not such a command.

I did level 1.

You can play the game in GWBASIC too, though you'll have to adjust the listing on three places (when the line breaks): 417 - below belongs to it; 490 - 520 belongs to it (goto 520); 1010 - 720 belongs to it (goto 720).

Later, Katzy.

I sent the zip too. Got 13,165 bytes on my computer, as bytes sent,
and on yours with ls -l command.

I am using it with Atari800Win.exe emulator.

Is this a cartridge binary?, or an 'Built-In' ROM?

I'm with Rick! When I first played Ultima III: Exodus, I had each one of
the towns hand-mapped out in a small journal I kept. I kept that up all
the way through Ultima V (on my ST), even recording the conversations of
the NPCs in each town.

The *only* way to truly play an RPG. :)

I am using it as an "attached" 16k cart in the emulator.

Foggy memories but I thought MS BASIC I & II on the Atari only came as
8k carts with a disk supplement. I'm not sure if this is a hack or
not. I took a look at it with a file viewer and it looks like it takes
up the full 16k.

I never had an old 800 unit. I bought the 400 and went from there. To
me, what you haave below is priceless. I would think most people would
ay about $150-$200.

I lucked out and got it all shipped to me for $50

4651. ISO: Pinball Construction Set disk image

Newsgroup: comp.sys.atari.8bit
Date: 2011-05-18 04:49:07 UTC
From: bill@newbreedsoftware.com
Message-ID: <4dd34fc3$0$1928$742ec2ed@news.sonic.net>
Source record: 740

I have Pinball Construction Set on floppy, from when I was a kid. I'd like to have it available to play at my Atari Party this year, but would prefer to boot entirely from SD2SIO or MaxFlash cart., so I'm looking for an ATR disk image.

I found one via AtariMania, but it has graphical glitches ("junk" next to some shapes, the balls leave trails of red rectangles, etc.)

Does anyone have one handy? (Consider my need "archival"... I don't know how much longer my floppy will last, assuming it even still works... and I don't have any means of creating or using a copyprotected duplicate (e.g., a .pro disk image).)

Thanks!

PS: My 4yo likes pinball (we went to Pin-A-Go-Go last weekend, and he enjoys pinball when we go to California Extreme), and he seemed to understand & enjoy what little I showed him of PCS on my 800Xl, despite the gfx glitches. ;)

I found this on the Holmes CD#1 at:

http://ftp.pigwa.net/stuff/collections/holmes%20cd/Holmes%201/ATR%20Games/Games%20M-Z/index.html

I don't know if the wrap on the news reader program will display the link
properly..

Thanks, I also just found a copy (a 1.5D disk, versus the SD disk I had)
here:

ftp://ftp.pigwa.net/stuff/collections/atari_forever/Tools%20-%20atr/

Aside from the lack of graphical glitches (at least in Atari800 emu
on Linux... and the other copy I had had graphical glitches on both
Atari800 emu and my real 800XL), and the fact that the disk image is
larger, the only other thing I've noticed (so far) is that the screen border
is black. On the (glitchy) version, it's pinkish.

Oh, the disk you pointed to seems to be the same as the one I found
via Atarimania.

In any case, I found one that looks like it'll work. Maybe I should make
a PBCS verison of Bally's "Star-Jet", which my son really enjoyed at
Pin-A-Go-Go. :)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

So on a whim I bought the AtariLab starter set (w/ temp sensor).
I gues only one other kit (light sensor) was made. I'll prob. grab
that eventually, but in the meantime, are there any homebrew things I
could do with this thing? Thx!

Back in the 90s I used a serial interface to connect my 800xl to my OS/2 machine, sending over the temperature every few minutes to update the temperature on my website. At the time it was very cool. :-)

Another subjective history. When micros first came out I was already 'in career' as a chemist. Boring, tedious, repetitive work: Mind numbing. I immediately saw micros as a way to automate some of the work in the lab so I bought myself an 1802 based kit and designed my own A/D daughter board. You wouldn't believe the resistance I got other people at work. Anyway shortly there after Atari came out with the 400 and 800 which made everything that had come before with the possible exception of the Apple II obsolete.

It would be another four+ years before things I had hoped for in data storage and elimination of things like transcription errors and simple errors reading and analog needle position were eliminated. It took even longer for people like HP and Beckham to start instrumenting their spectrometers and HPLC equipment. I mean you really had to be their when your working with a drug that sells for a $1/4 million/ ounce for a week and you loose the results because the ink ran dry or the paper ran out in your chart recorder! I mean you start fearing "No G.I. Joe with the Kung Fu grip for little Jimmy this Xmas!"

So anyway other then me I'll tell you up front there is a real lack of interest in anything that relates to this topic. Later I went on to J/ S switched 300 Watt 120V triac switched controllers for the Atari with more then a few relay and A/D stuff. For instance that cartridge bird nest nightmare functioned<had I wire wrapped it robust enough to survive shipping> was an 8 bit D/A converter. Thing is I still find it a fascinating topic!

OK, one of the mostly ignored <has it really been decades since the first set back thermostat was made?> is home energy smarts. It is still on average in the 1950's. All the dumb stuff like insulation and double paned windows has been done but there just isn't a lot of smarts built into the system. Since you live in Davis there is nothing I can tell you about swings in temperature from cold Tule fog in the morning to my gawd I think I am going to melt suffocating heat in the afternoon.

Now if a guy just had a simple system like a temperature sensor or two <s>he could make some automatic decisions. Minimally put one sensor outside in the sun and if air temp or radiant heat was enough to cook an egg at 7AM you may want to shut off the heater before the house goes from heater on to air conditioning on in the blink of an eye. If it shuts the heater off and hour earlier and the air conditioning comes on an hour later, well that saves money.

If you had two sensors outside, you could put one in the sun and one in the shade to give you an idea of air temp vs. radiant heat.

Of course you couldn't do it with existing construction, to much dust and bat poop in the attic, but you could put the attic to work as a solar collector and storage. Just two simple fans with the option of turning them on and off independently. One fan blows hot air out to keep the temp down while the air conditioning is running. You shut this one off an hour or so before the sun goes down to store heat. Second fan circulates hot air from the attic into the living space when and while the air in the attic is warmer the the air in the living space. If you wanted to do something a little more sophisticated, you could feed the preheated air from the attic into the furnace system to recover heat lost through the ceiling or whats left of solar. i.e. if the attic is at 50 degrees and the outside air is 40, feeding the attic air into the heater will make it do more work for heating the living space.

Ah, I still get sucked into this. If I had any sense I would have been into more sexy projects like Mega Squirt fuel injection!

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Rick, that was a very detailed account. Wow.

Gozar, how exactly did the temperature probes work with your website?
That is really really cool.

You know what would be cool? Having a Atari BBS with a temperature
probe set up like that. Select a option on the BBS and get the probe's
reading.

Heck, would be good while computing at your desk and you wanted to know
what the room temperature was.

you know, I found the Atari 800 XL and the Atari 400 keyboard pinouts
were very similar. Just had to switch a wire or two. Now I was able
to get a 400 keyboard to work on a 800XL, but never tried it the other way.

4674. Seattle Retro-Computing Society's inaugural meeting June 25th

Newsgroup: comp.sys.atari.8bit
Date: 2011-06-05 05:46:08 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <3fe93e56-062b-4867-87eb-6914a60f5421@glegroupsg2000goo.googlegroups.com>
Source record: 662

I am pleased to announce... the Seattle Retro-Computing Society's
inaugural meeting, on Saturday, June 25th, 2011!

Do you do any of the following with old computers near Seattle?

+ Use them
+ Collect them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," as I expect it will be if you're reading this
near Seattle, then the SRCS is for you! We exist so you can show off
your awesome stuff, bounce ideas off of fellow enthusiasts, and be
inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor
of vintage machine you prefer! Come on down and tell us about it!

The meeting is graciously hosted by the Living Computer Museum, a
relatively new organization which is building a computer museum in
Seattle's SODO neighborhood. There will be refreshments, presentations
on various vintage topics of interest, and enough table space & power to
set up anything you may want to show off!

For further details, please see our page at http://srcs.nfshost.com/.
Hope to see you there!

4675. Wanted SpartaDos X cartridge

Newsgroup: comp.sys.atari.8bit
Date: 2011-06-07 00:55:42 UTC
From: phantomm_1 <phantomm@suddenlink.net>

Source record: 664

Greetings,

Looking to purchase a original ICD SpartaDos X cartridge.
Version of cartridge isn't important to me, as long as it works.

If by chance you have a damaged one, I may be interested it
it as well, as I do circuit board repair among other things.

I have original SDX Manual and the reference manual.
As well as disk based Sparta Dos and manuals, ToolKit,
FlashBack and etc.

Need SDX cart for use with My ICD Multi I/O for a project.
Surely somone has a extra one that there not using.
I've some cool 8-bit software and some hardware for a nice
trade.

Will pay resonable price, or trade Atari 8-bit, ST,STe,Falcon hardware,
software, books/manuals of equal value.

Contact me at: phantomm@suddenlink.net
Will provide phone number so we can discuss.

Sincerely,
Barry
phantomm@suddenlink.net

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Sorry for the two postings of the FAQ in quick succession. I won't bore you
with the full explanation.

On the bright side, I think we have all the pieces of the faq posting tools
working properly again, so hopefully things will go smoothly for a while.

4679. Photos from Atari Party 2011 in Davis, CA!

Newsgroup: comp.sys.atari.8bit
Date: 2011-06-16 01:06:41 UTC
From: bill@newbreedsoftware.com
Message-ID: <4df95721$0$2154$742ec2ed@news.sonic.net>
Source record: 668

Here are some photos from last Saturday's Atari Party, that I held
(with tons of help from friends) in Davis, California:

http://www.newbreedsoftware.com/atariparty/2011/photos/

It was mentioned ahead of time in a couple local papers
(Sacramento News & Review, The Davis Dirt, and I think also the
Davis Entperirse).

PLUS, a few of us got to hang out in CW31 TV's green room during that
morning's live broadcast of "Good Day Sacramento" to play games and
talk about the event. I got my butt kicked at Mario Bros. on live TV. :^P

Links to even more photos, plus the video, can be found under
the "Latest News" section of the 2011 event's home page:

http://www.newbreedsoftware.com/atariparty/2011/

Enjoy! And thanks to everyone who came to show off their game systems
and computers, the volunteers who helped us set things up and clean up
afterwards, and of course the many sponsors who helped pay for the event
and donated lots of give-aways.

BTW, we had over 100 people show up (based on raffle ticket counts, there
were at least 100 people; though we stopped giving them out when we did the
raffle, about 3.5hrs before the event ended, so it could've been closer
to 120 or 150, for all I know!)

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

From: Gaston Verhulst <gastverh@gmail.com>
Message-ID: <97b9f0bb-ea3f-46b0-8520-8c9a5c7ade8e@l6g2000vbn.googlegroups.com>
Source record: 673

Hello,

On 4 feb 2009, 19:29 I asked in this newsgroup with the same subject
something about running atari++.

Then I have received splendid helping replies.

In the main time I had many worked many times with atari++

With a new installation to Fedora Core 15, I unfortunately lost
the .ATR files in order to run atari++.

Sorry that I did not make a backup of those .ATR files.

Please can anyone send me the files again?
Or is there a site where I can download it?

Many thanks in advance for any answer.

Gaston Verhulst.

Strange enough, I wonder what you really need, because the emulator
itself doesn't require ATR files by itself, strictly speaking. These are
only (one of the file types of disk) images the thing supports. It also
supports binary executables out of the box.

IOW, I guess you probably need to be a bit more specific.

> Please can anyone send me the files again?
> Or is there a site where I can download it?

Not any ATR files. The emulator is still here:

http://www.xl-project.com/

though probably in a later version with more capabilities than you had.

So long,
Thomas

Maybe he want to download ATR for using on the emu. Find some here :
http://pokeysoft.no/games/atari/a8list.htm
http://www.atarimania.com/
http://atari.fandal.cz/

I think you find almost everything you should need here.

Good luck
Hawk of Pokey Soft

Hello, thank you both for your quick replies.

Please, sorry that I have not more specified about the files.
In the mean time, I have found something of the right names in my
notes.
I didn't find them before ...
I was looking for MYDOS45.ATR and ATARIBAS.COM
And searching in Google for those words, I could download them from:
http://sourceforge.net/projects/atari800/files/ROM/Original%20XL%20ROM/
but in xf25.zip there is MYDOS45D.ATR and with that I have some
troubles.
I found the right one in
http://www.filewatcher.com/m/MYDOS45.ATR.92176.0.0.html
From now I can run and use atari++ successfully an do some tests and
save programs.

Kind regards,
Gaston Verhulst.

With MYDIS45.ATR and ATARIBAS.ROM, from now I can write programs which
I can save and load and play.

In your links above there are many games with either .atr or .bin
format.
I can easily donwload them in my home directory.
Please how can I run one of those games with the atari++ emulator?

Many thanks in advance for any helping answer.
Gaston Verhulst.

Load them as disk images into the virtual disk drive. On the right hand menu, go to "drive 1", select the item "Image.1" and then, in the file requester, select the file you want to load. Both disk images as well as binary load images will work "automagically".

Greetings,
Thomas

Hello,

there used to be numerous flame-wars between Sinclair-, Commodore-, ATARI-
users and users of other classic computers during the last 30 years and I've
made a poll where you can decide which classic non-IBM computer is the best.

You can vote here anonymously:
http://www.misterpoll.com/polls/527628

Here you can view the current results:

http://www.misterpoll.com/polls/527628/results

Here's the message forum of the poll:

The problem is best for what? That was the point in my view. At the time, if
you were educating you could not go wrong with the BBC, but if you were on a
budget and needed it to be a jack of all trades, arguably the Spectrum was
the one.
Lots of other computers were, in my view better, but did not get supported
or were marketed badly.

Brian

In the UK market where British was always best (even when it clearly wasn't) and people had no money (or were just too tight), but just about anywhere else those options were pretty poor IMO.

The ZX was cheap and cheerful but it was useless as a proper home computer due to it's awful keyboard and overall size. The BBC might have had a lot of educational titles and the computer of choice for that reason in the UK, but elsewhere in the world it didn't make that much of an impact.

We had Microbees in high school, and they seemed to be a decent solution for education but realistically they could have been replaced with C64's and it's massive range of educational titles and programming languages (including BASIC extensions) would have been a far better solution. The Atari 8 bitters had a lot going for them too IMO, except for the ones with the shithouse keyboards.

I voted for the Apple II as best during that time period.
Suprisingly, it is scoring pretty low.

However, today, I prefer the Commodore
64 for games and as a hobby computer.

The BBC Micro was a bizarre project. I've never to this day seen a good explanation of just why the BBC needed to release its own computer to accompany what was really a rather unimportant television programme. There isn't a Top Gear motor car, is there? The result of it was wholly negative, with schools stuck with zillions of computers that were an evolutionary dead end in technology terms, all because of that "BBC badge".

It's like that stupid Domesday video disc. What on earth was the point of that?

I voted for the Sinclair ZX81 due to its low IC count -- only 4 or 5 (depending on RAM-type). The keyboard reminds of modern multitouch screens on mobile devices and there is an emulator for Android: <http://www.appbrain.com/app/zed-ex-(beta)/org.helllabs.android.zx81>. The ZX81 was also the cheapest of the classic computers.

I have an Apple II Europlus but I don't think the probably resistive keyboard is that good. You have to strike the keys hard in order to type. Mine stood in a damp unheated garage for many years and that might have affected the keyboard. It also has lots of ICs that could break.

There was also the Luxor ABC 80 that had a very good capacitive keyboard <http://en.wikipedia.org/wiki/ABC_80>. Quite a few chips there as well.

I also have the Commodore 64 and it works well and is interesting to use with COMAL cartridge.

Oh yes, you really are making my point here. I deliberately went UK as the originator went US Ataris, though nice machines were far overpriced over here until it was too late. Yes, the silly stepped flat pad keyboard on the early Ataris was rubbish. The 800XL I had with disc, printer interface etc, was a great little machiine as I got it cheap end of line.
The Spectrum, the later models were actually quite good. I actually used one to do online editing work in the 80s. The snag was the edge connector, if only it had had a proper plug it would have been respected more.

Over here of course the Dragon was quite popular, and as far as I'm aware it was basically a slightly redesigned Tandy color computer.

There were lots of oddballs though.
Oric, Lynx, Enterprise, Sord, Einstein, etc.

Not to mention Memotech.

the most important thing about the bbc micro computer coming from a
comprehensive was that there were not enough for all the kids in a
class and that the teachers children all had one at home....

4702. emulating 800 computer: ultima 3 (black and white only)

Source record: 691

Hi all,

I am using the software, Atari 800 WinPlus, on Vista to emulate the Atari 8-bit computers. I was testing the Ultima 3 game (*.atr file) and I noticed that it only displayed in black and white. There were no colors. It seems to work though.

I tried some other games, and they did have color, just not Ultima 3 (and perhaps some others in the Ultima series).

I would really like play Ultima 3 in color. Has anyone encountered this situation before and know how to resolve it?

Thanks in advance!

Er, you do realise the BBC didn't actually design and build the BBC
Micro, don't you? It was made by Acorn and just badged/endorsed by
the BBC.

So it wasn't an evolutionary dead end either - it's successor the
Acron Archimedes was backwards-compatible with the BBC Micro to some
extent, and a very nice piece of kit to boot.

I know that, but they badged it, marketed it and endorsed it. I just found the start of the first episode of The Computer Programme on Youtube, and it's basically an advert for the BBC Micro. It would have been understandable to an extent if it were some kind of programming course and they wanted standard hardware, but it was just the usual general BBC documentary. I don't really understand what they thought they were doing; the programme was too vague for anyone actually involved with comptuers- sort of, "you can run a car factory with one" type of stuff- and who else was going to be interested? It certainly didn't teach you to use a computer. Computers are tools, and people got to know how to use them when they had to, like my mum who learned when she got her first job with a word processor.

So having a BBC Micro just seems inexplicable for any practical reason. There wasn't a BBC food mixer to accompany Fanny Cradock or a BBC lawnmower to accompany Gardener's Question Time.

I can't help getting the feeling it was just some Beebocrats wanting to feel more important than they deserved. Probably the same reason for the equally incomprehensible Domesday video disc thing.

> So it wasn't an evolutionary dead end either - it's successor the
> Acron Archimedes was backwards-compatible with the BBC Micro to some

Well *shrugs*. We all use PCs and Macs these days, and by 1982 it was pretty obvious already that that was more likely kit to conquer the world. Instead, we got this bizarre thing that the BBC endorsement and heavy plugging basically said, "this is the computer that nice middle class Blue Peter

families have", and as a result they ended up in schools being like nothing anybody uses in the real world.

But then, I've never understood why there was this big "computers in schools" thing either. If you haven't got one at home, you don't get enough experience to really learn anything useful. If you've got one at home, why do you need lessons at school? I taught myself Z80 assembler. I think everyone else did, didn't they?

Sorry, waffling. I just think the whole idea of a BBC micro was bizarre.

Ian

That's ok at the beginning when no-one knows how to use a word processor and companies expect to have to spend their own money training employees. When some applicants have the skills already and others would have to be trained before they could start working then they aren't going to employ untrained people! It's not just a computer thing. Night schools used to do courses in typing and shorthand etc to get you qualified for admin jobs.

> So having a BBC Micro just seems inexplicable for any practical reason.

Someone had to put computers in schools it just happened to be the BBC. The BBC has always been involved in education (after all it is one of the reasons they exist).

Later Acorn computers were equally overrated.

I had an Acorn A3000 and there was nothing remarkable about it, in fact the
best thing about it was that the rather nice monitor worked very well with
my Amiga when the 1084S dropped it's flyback..

I thinkt the commisioning of a BBC Microcomputer was more to do with
education in general than just the TV programme.
The BBC's close links with governments and its non-commerical angle
made it a powerful entity in which to educate kids on technology and
IT.

In that respect I think it did very well and the BBC was a very
versatile machine with its User Port, Serial and Parallel ports,
pluginable ROM modules and a decent keyboard and monitor.
It wasn't quite up there in the gaming end however.

Yup, just need 250 votes to have a valid and conclusive result.

> this situation before and know how to resolve it?

Some games, including Ultima and Pinball Construction set, utilize
the Atari 8-bit's high-resolution (320x192) 2-color graphics mode,
and took advantage of the 'color artifacts' that you'd see when
using RF or composite.

By default, since it's faster to render, emulators show you exactly
which pixels are lit up, ignoring the artifacting. It's what you'd
see on a real Atari using separate Chrom/Luma outputs on a nicer
monitor (like a Commodore 1802).

I don't have Windows, so am going off of Atari800 (upon which
Atari800Win is based), but it should go something like this:

[F1] to bring up the menu
Arrow down to "Display Settings", hit [Enter]
Hit [Enter] on "NTSC artficating quality" and choose an option
(other than "off") -- I just discovered the recently-added
"NTSC filter", which presents a larger screen with a little
bit of black interleaved between each scanline, and some other
non-perfect artifacts. It looks very good! A lot like my old
Trinitron TV :)
If you select "original" or "new" (not "off" or "NTSC filter"),
the "NTSC artifacting mode" option becomes available, and
you canplay with options in there

Enjoy!

Hello!

I got an Atari 130XE, but it has no ROMs (System and Basic) in its
sockets..

Does someone know, which types of (E)PROMs these ROMs are? Is it
possible to get an Image of these two ROM ICs?

I hope, someone can help me.

Best Regards, Xaar.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

They must have thought they were more valuable than the computer as a
whole, or perhaps they used them for parts for one in better condition.

I've looked for EPROMS in modems and soundcards at thrift stores before,
perhaps someone did something similar?

Wrong point of view.

The BBC was released as a do-it-yourself project picked up by a
commercial market.

There were similiar projects in germany around the same time, all named
after the television stations running these diy projects: the
NDR-kleincomputer, the WDR-Computer and others... some of them numbering
several thousand systems and becoming the second most sold computer at
that time.

If you started in 1980 building your own computer as instructed on
television you got a Z80 system with 4kByte memory and tape support. The
OS was a rather simplistic hex monitor.

By continuing until 1988 you ended up with a 68020/68881 workstation
with 8MB memory, SCSI support and some expansion card system running
several operating systems like CP/M 68k, TOS/GEM (yes, there was an
illegal port), Coherent and others. I think there even was some open
source reimplementiation of CP/M 68k based on ideas from the television
show becoming very influential to early open source ideas.

Funnily/Sadly while the NDR/WDR-computers were quite capable and widely
used they never created a commercial followup market.

Nonetheless it didn't enjoy the same success as the C64. And--even if strangely--almost no software was ever made for the C128, yet software for the C64 was STILL being made and sold (even if for no other reason than that you could run it on the much newer C128 hehehe). (I believe that software developers should have made a go of it, but that never happened.)

And since I never owned and barely ever used the C128, I don't really know so much about it that I should vote for it hehehehe

Well, I really do not know.. I now got some ROM files, and put it on some EPROMs (27128 for System, 2764 for Basic).
Unfortunately does the Computer not start.. :(I guess there are some more broken circuit lanes on the PCB, I already fixed 24 broken lanes by rebuilding their function via wire...

But I will get an fully functional 130XE during the next weeks, so I can take a look.

Best regards, Xaar.

The OS ROM is a standard pin out 27128 type. It is likely the BASIC ROM is an Atari mask type ROM, 24 pins vs. 28 like you would see on a 2764.

These are just a guesses: PO probably had a modified OS and maybe expanded RAM. The modified OS could have been anything from something compatible with older software to one with built in high speed disk routines. Ram expansions sometimes use the 6520 PIA CS pin to the BASIC ROM for banking RAM. Heck, I used to replace the ROM with ASM/ED ROM so who knows?

B&C Computer Visions at www.Myatari.com has the BASIC chip for $12. Some people would prefer to leave the built in BASIC out of the computer and just use a BASIC cartridge. That way if you did decide to expand the memory you have the PIA pin available.

Just for the record, I think everyone has switched to flash ROMs. I seem to be the last man standing using UV erasable EPROMs. You

probably should go that route with respect to a replacement OS. There are images of OS as well as BASIC for that matter if you want to burn your own.

I've still got them, and plan to continue using them (no point buying new equipment when the old stuff still works). Of course, it's been a few years since I've actually done it. :)

No it wasn't. It was commissioned by the state broadcaster from Acorn in
a sort of fit of corporatist paternalism. And nobody* bought one.

That's absolutely nothing like the BBC Microcomputer project. Had the
BBC programme been something like that, I - and I suspect Ian - would
have been slightly better disposed towards it. But it simply wasn't.

The BBC decided in the early '80s that it had to produce a series of
shows on TV and radio about computers, and therefore (for some reason)
needed its own machine. Not its own *design* that it would show people
how to build; its own machine, in the shops, with a BBC logo on the box
and the newsreader Kenneth Kendall's voice in the optional speech
device. It invited tenders for the contract requiring certain features
(Sinclair submitted one and - according to the Beeb - failed to meet the
spec.; it became the Spectrum) and Acorn won. The machine was then sold
as the BBC Microcomputer.

And nobody except schools and rich parents bought one, because it was
significantly more expensive than the competition. Even Acorn recognised
this, and released a cut-down version under its own brand, the Electron.
The BBC, though, defiantly - and hilariously, to we Speccy and C64 kids
- continued to refer to it as ï¿½a typical home computerï¿½ at every

opportunity through the 1980s. That was all they did. I don't recall it being used on air for anything much more technical than demonstrating, briefly, what the ï¿½typical home computerï¿½ could do.

The entire project was a complete waste of time and money. Sinclair (and Commodore) did *vastly* more for the advancement of home computer technology in Britian during the 1980s than the BBC.

*For certain specific values of ï¿½nobodyï¿½. Schools (whose purchases were subsidised) and rich kids.

I make no comment as to the merits of the BBC spending licensepayer funds to compete in the computer market, nor attempt to compare the BBC machine to Spectrum of C64. However I do believe that the BBC contains some pretty nifty engineering:
- a 3 pass macro assembler built in to the BASIC
- a CLI & OS that allowed multiple extensions to be plugged in, so it was very easy for 3rd party development of ROMs that added additional CLI commands, device drivers, file systems etc that were all interoperable.
- econet - LAN client/server technlogy that is long since surpassed by ethernet and TCP/IP but I think was way ahead of anything that came 'out of the box' with other 8-bitters, and probably matched only by Apple 2 3rd party products.
- the 'tube' interface - a co-processor port. From what I understand, ARM microprocessors that form the basis of so many embedded devices today started life as a BBC co-processor

Also, 'elite' was first developed for the BBC

Yeah, a 2764 won't work for BASIC. You'll need 68764 or the like or, as
mentioned in another reply, buy a BASIC ROM from Best. If you don't find
what you need, I can burn you whatever rev you want onto a 68764 and send
it at cost.

Apparently Rick's not the only one who hasn't moved away from eprom...

I think the Bob's 1200XL built in BASIC mod piggybacked a 2764 onto a
27128 with the OS. He did a lot more then one mod but I am pretty sure
at least one was an OS in 27128 vs. the two 2764 ROMs a 1200xl would
normally be used. If Brian goes with a 2764 it would probably be less
work then making the on board BASIC socket work.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Way to go, Sal and co.!

That's a bold claim "the most well-written game of all time on the
8-bit," but having watched the video I'll grant you Space Harrier
appears to be one of the most graphically-advanced 8-bit games, and
with music and voice. There's still the matter of play value and so
forth that I don't know about yet (but it looks to be there).

You put a fair price on it, hope you make a little money too!

I must have missed the point in this thread somehow. Where does it
become less work to piggy-back a 2764 onto your OS than to just put the
correct chip in the BASIC socket?

4741. Atari Corp. History question

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-12 05:58:58 UTC
From: Ben Corr <bjcorr@sonic.net>
Message-ID: <4e1be2a2$0$2160$742ec2ed@news.sonic.net>
Source record: 630

Hey all, I just delivered some Atari equipment to Judith Hammerle of the Digital Gaming Museum in Sunnyvale CA, they are setting up a display of Atari memorabilia as part of a remembrance of the glory days of Computer Gaming Companies in Sunnyvale. Judith had some questions she wanted me to ask the members here due to everyone's knowledge of Atari's history and I quote;

"I'm trying to figure out all the places Atari occupied in Sunnyvale, and it's not easy. For example, this site says that Atari was at 1196 Borregas. The Energy Czar manual lists 1195 Borregas Avenue as the Consumer Division. Were they in both places? Maybe. I know they started in Santa Clara,at 2962 Scott Boulevard. and that the famous Pong quarters overload was at Andy Capp's Tavern on El Camino (157 W. El Camino Real, now Rooster T. Feathers, a comedy club). But there's a mention of an "abandoned roller rink" where the first manufacturing" was done, but I can't find an address. I also have 1265 Borregas Avenue, site of Atari's first headquarters, and 1340 Bordeaux Drive, Customer Service Department (off the Energy Czar manual).

Do you suppose that there is someone on the Atari group you mentioned who would know these things? Can I join the list and ask questions? Any help you can give clarifying Atari in Sunnyvale would be appreciated."

I'm going to get Judith on the newsgroup so you can post any answers here or email them to Judith at judith@digitalgamemuseum.org.

I've made attempts to mention important Atari addresses in my Atari
history timeline:
http://mcurrent.name/atarihistory/atari.html

First location (1972):
2962 Scott Blvd., Santa Clara, CA

The roller rink set up by Bill White for Pong production (1973):
1600 Martin Ave., Santa Clara, CA

Mass production and company hq (1973):
14600 Winchester Blvd., Los Gatos, CA

Kee Games (1973):
330 Mathew St., Santa Clara, CA

Kee Games (1974):
1280 Reamwood Ave., Sunnyvale, CA

Atari (incorporating Kee) (1975):
2175 Martin Ave., Santa Clara, CA

Company hq at Moffett Park (1976):
1265 Borregas Ave., Sunnyvale, CA

Coin-Op (1982):
790 Sycamore Dr., Milpitas, CA

Atari Corp. (1984):
1196 Borregas Ave., Sunnyvale, CA

Atari Games Corp. (1984?)
675 Sycamore Dr., Milpitas, CA

I'll assume the BASIC chip on his 130XE was soldered in which means
the replacement will have to either be soldered or a socket soldered
anyway. I don't like the quality of post Tramiel PC boards and would

take piggybacked over soldering on a 130XE moboard.

Brian's at an incredible number of traces fixed and still having problems. IMHO it would pretty much cut his work in half to just fix the OS socket and piggy back an EPROM on it then fix the BASIC ROM socket. For that matter, path of least resistance may be a BASIC cart. Heck, its a hobby, he can do whatever he wants.

The following is taken directly from
http://www.cooganphoto.com/gravitar/1982.html which is a mirror of the
former web site by Donald A. Thomas, Jr.

An Atari, Inc. Facilities Map dated October 1982 depicts 70 Atari
locations within the Silicon Valley. The locations, in order as they
appear on the map, the number assigned to the location by Atari and the
departments (if known) are as follows:
SUNNYVALE (33 locations)
1265 Borregas Avenue (#100) [Corp. Office/Game Room]
1272 Borregas Avenue (#101) [Consumer Engineering]
1215 Borregas Avenue (#102) [Company Store]
[2600 First Production Facility]
1320 Bordeaux Drive (#103) [Service Center]
1196 Borregas Avenue (#104)
[Consumer Product Programming]
1399 Moffett Park. Drive (#105)
[Home Computer Marketing, Sales & International]
1195 Borregas Avenue (#106)
1349 Moffett Park Drive (#107)
[Reseller Shipping & Creative Services]
275 Gibraltar Drive (#108)
[Consumer Product Programming]
1173 Borregas Avenue (#109)
[Manufacturing and Product Engineering]
1171 Borregas Avenue (#110)
1180 Bordeaux Drive (#111)
360 Caribbean Avenue (#112)
390 Caribbean Avenue (#113) [Atari Company Store]
1340 Bordeaux Drive (#114)
1342 Bordeaux Drive (#115)
1344 Bordeaux Drive (#116)
1346 Bordeaux Drive (#117) [Customer Service]
155 Moffett Pk. Drive (#118)
[?Secret? Lab for Quick Games]
1383 Borregas Avenue (#119)
1393 Borregas Avenue (#120)
1183 Bordeaux Drive (#121)
1235 Bordeaux Drive (#122)
1312 Crossman Avenue (#123)
[Customer Service, Product Specialists & Parts]
292 Gibraltar Drive (#124)
603 Baltic Way (#125)
234 Caribbean Drive (#126)

1394 Borregas Avenue (#127)
1105 Fair Oaks Avenue (#203)
1285 Forgewood Avenue (#206)
570 Britton Avenue (#211)

Congrats to Chris Hutt (and you to, Sal!) It's been a long time coming!

> Come Check out a video of it in Action and see what we are calling the most
> well written game of all time on the 8-bit.

So out of curiosity, what are the advantages to the cart version versus
a disk-based one (assuming it's being made available)? Not to be cheap,
it's just (1) hard to justify [*], and (2) I'm curious about these fancy new
carts. :)

[*] Though some day I will buy a copy. :) This game is tops!

Well the Reason for the Cart is that the game takes up 1024k of Space.
So chris put it on a 1024k Cart so it could bank switch the data one
64k chunk at a time from the cart game in to the Ram of the system
(which is on average 64k).

Also, Disk Loading would be unbearable. it would take forever to load
each level and would have to stop the game to load more data sometimes
in Mid Gameplay.

4750. ****VARIOUS ATARI XL/XE ITEMS WANTED*****

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-15 18:07:10 UTC
From: phantomm_1 <phantomm@suddenlink.net>
Message-ID: <4e2081d0$0$8705$bbae4d71@news.suddenlink.net>
Source record: 639

Greetings,

I've been using Atari 8-bit Machines for a few years, and am always looking
for items to add to my collection.

*****
Current want List....
Atari 8-Bit Items...
SpartaDos X cartridge (I have the original Manuals and etc.)
Atari 410 or 1010, program recorder. Pefer a 410 if I can find one.
Happy Controller board for a 1050, (Not the Happy Board).
However if you have both installed in a working 1050 for sale,
then I maybe interested if price is right.

ICD Multi I/O 256meg or 1meg unit.
Sparta DOS US Doubler for 1050 upgrade, or
1050 with the US Doubler already Installed.

Also, looking for Midi Mate, and any voice/audio digitisers and
Video/Scanners for Atari 8-bit.

Contact me at:
phantomm@suddenlink.net if you have any of the above items for sale or
trade.
Or If you have any Atari 8-bit items, that are rare, or not well known
about.

thanks,
Barry

4752. 8 Bit Weapon (band)

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-15 23:49:29 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e20d209$0$2147$742ec2ed@news.sonic.net>
Source record: 641

So the other day at California Extreme (the annual arcade & pinball
show in the SF Bay Area) I ran into Seth & Michelle, the duo that
makes up the live chiptune band 8 Bit Weapon (http://www.8bitweapon.com/)
and asked if they're ever going to do any tunes with Atari 8-bits.
(They use a lot of C=64 and SID, some Nintendo Gameboy, Apple II, Atari 2600,
etc.)

Turns out, they don't have an 8-bit, and would like to get one to add some
POKEY to their music. (I think Seth mentioned preference for an 800XL...
I had my 4yo son running away when I was trying to talk to them, so cut the
conversation short :))

Has anyone got a system they'd be willing to donate to the band, so we can
get some representation? ;^) I've only got my 800XL and 1200XL, and a torn
up 800 that I used (and will use again) as an exhibit piece at my
Atari Parties out here in Davis, CA.

4756. google groups killfile

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-17 15:06:55 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <0d30d736-ccc1-402b-b5fb-2ba23dc1ff53@m6g2000prh.googlegroups.com>
Source record: 645

I do get the difference between a real newsgroup reader and google
groups. Since the last time this topic came up I certainly didn't know
and I suspect from the responses some people weren't aware of it
either, there is google groups killfile functionality for firefox. You
need to get
grease monkey
http://www.greasespot.net/
then d/l a script
http://www.penney.org/ggkiller.html

It seems to work slicker then snot on a doorknob for routine killfile
by author and I think it works with wildcards. Now if I could only
figure out how to get it to killfile by subject...

30 POKE 756,152
```

I be pretty slow. Took me 4 months and the Ultima artifacting question before I got around to reading Mapping the Atari again and getting this sort'a worked out.

Not that anyone would want to do it but replace the lines in my GR. 12 redefined character set demo with these. It should be as easy as loading the first program with all its data statements then ENTER"D:THISONE.LST" or whatever you want to call it. Of course type over or entering from the BASIC editor would work too. I could have cut and pasted the data statements from the original post but I am trying to save on electrons. j/k

Using Atari800win Plus 4.0 it looks pretty good after setting [View => Artifacting => Blue/Brown 1]. I have to take another look at this on a real Atari and a decent composite monitor to see if it still works. I *WISH* Atari in their wisdom had given us a 256 character set instead of 128. I was fooling around with my new EPROM burner, getting old character sets off of IBM CGA cards when this limitation hit me. 256 characters would have been so much more useful then inverse. A games that used artifacting like Ultima and Caverns of Calisto could have been done in GR. 0 with better performance and smaller memory footprint. Anyway, a pretty good show and tell on what can be done with a redefined, artifact, graphics 0 character set.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

HardwareDoc (of the ABBUC club) is producing the Midimate V2.0 currently - it comes as a DIY kit with solder pads for a SIO plug and will hopefully be available on the Fujiama 2011 Atari meeting in Lengenfeld (Germany, near the Czech border). He also produces Nunchuk controller adaptors (very nice for games like Space Harrier):

<http://www.abbuc.de/~hardwaredoc/projekte/hardware/midi/index.html>

HTH,

Thorsten

Greetings,

I've been using Atari 8-bit Machines for a few years, and am always looking
for items to add to my collection.

*****
Current want List....
Atari 8-Bit Items...
SpartaDos X cartridge (I have the original Manuals and etc.)
Atari 410 or 1010, program recorder. Pefer a 410 if I can find one.
Happy Controller board for a 1050, (Not the Happy Board).
However if you have both installed in a working 1050 for sale,
then I maybe interested if price is right.

ICD Multi I/O 256meg or 1meg unit.
Sparta DOS US Doubler for 1050 upgrade, or
1050 with the US Doubler already Installed.

Also, looking for Midi Mate, and any voice/audio digitisers and
Video/Scanners for Atari 8-bit.

Contact me at:
phantomm@suddenlink.net if you have any of the above items for sale or
trade.
Or If you have any Atari 8-bit items, that are rare, or not well known
about.

thanks,
Barry

4766. Re: high speed driver for APE

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-26 15:47:16 UTC
From: Rybags <rybagz@gmail.com>
Message-ID: <ce7b000c-149c-4f30-b32a-aae480e61943@g3g2000prf.googlegroups.com>
Source record: 555

The standard OS can't boot at high speed and you can't preload a handler safely without the high possibility of the disk you're booting overwriting it.
Best option is a custom OS like the Warp+ one in the AtariMax 32in1 upgrade.
Another possibility would be to have a patcher that added high-speed to the existing OS and runs the OS from RAM and forces a disk boot but then there'd be issues of compatibility and the possibility of your patched OS getting wiped. Plus it adds extra time to the overall process to the point you'd probably not save much if any load time.

I did it. I lost my first listing, got a new computer and guess I
didn't save MICKEY.BAS.
Took me a while to realize I had to put a EOL at the end of line 275
for it to translate to ATASCII for me.
It is interesting what you did with artifacting, but I like the
original colors better.
I mostly go to atariage for discussions now.

4770. Free: Atari printed/copied docs [valForth, Data Perfect, Family Finances]

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-31 20:20:14 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e35b8fe$0$2175$742ec2ed@news.sonic.net>
Source record: 559

Last year I inherited some old Atari 8-bit stuff, and among it was a couple of binders of photocopied or printed documentation. I'm going to dump it in the recycling bin, unless anyone out here has any use for it, and gets back to me soon (I'm moving across town in a few weeks!)

* valForth Player-Missile Graphics
* valForth 1.1
* valForth Tutle & valGraphics and Advanced Floating Point Routines
* valForth Display Formatter
* valForth Advanced 6502 Macro Assembler
* valForth Text Compression and Auto Text Formatting
* Data Perfect (manual)
* Family Finances (manual)

I'm in Davis, CA, if you want to swing by and pick it up (and chat over some coffee), or we can talk about shipping.

Thanks!

4772. Free: Various Atari cassettes and disks

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-31 20:51:57 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e35c06d$0$2139$742ec2ed@news.sonic.net>
Source record: 561

From the same collection I mentioned (with the valForth, etc. docs),
I've got a pile of cassette tapes and 5.25" disks for the Atari;
a variety of stuff I haven't looked over closely, and probably never will.

Some of it's data files, and from the fellow's own collection of stuff,
but a bunch of it is ANTIC software (actual ANTIC disks, or typed in
from magazines, from what the labels show). Some of it is obviously cracked
stuff (e.g., some disks with a collection of games that I recognize as
commercial titles that'd never be on a XIDEX floppy with a hand-written
label ;))

Would this be useful to anyone, or should I ditch it or find somewhere
to donate it (who'd want it, outside us folks!?)?

Thanks!

4773. Free: AtariMax SIO2PC adapter (serial; you pay shipping)

Newsgroup: comp.sys.atari.8bit
Date: 2011-07-31 23:13:04 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e35e180$0$2199$742ec2ed@news.sonic.net>
Source record: 562

Back before I got an SIO2SD, the last device I used to boot my Atari
was a Linux PC with an serial SIO2PC cable that I bought from
Steve @ AtariMax.

It worked last I used it, but I don't have any PCs with serial ports
to test it with. It has an SIO jack on it (I guess sometimes they don't?),
and on the bottom it says: "AC-02 5203". On top it says "(c) 2003 SJ Tucker
SIO2PC Universal."

I've got a serial cable I'll throw in. I MAY have a spare SIO cable if
you need it.

Come get it in Davis (near Sacramento), California, or you pay shipping.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, the Atari computer intellectual property rights, along with the
home market rights to the Atari trademark itself, are owned by
Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France.

Yeah, I drop by Atari Age every once but not enough time to
participate.

My posts are more like senile ramblings lately. Just to make them into one cognitive thought. One of my favorite games of all time was Pools of Radiance which never made it to the Atari. I still play a lot of Rogue. We never got a good Rogue either. I loved Dungeon Master too.

Had Atari made a 256 character mode it would have made the graphics for porting those types of games *SO* much easier. Specifically they should have used the high bit to switch character sets instead of providing inverse. This would have made it trivial to mix graphics and 40 column text on the same line. There's something like 85 printable ASCII characters so you are limited to 43 redefined characters and artifacting if you want color. I liked the Ultimas which used artifacting but for several reasons don't like doing it myself. Being able to switch between a graphic 0 and graphic 12, each with their own character set without resorting to DLI's or kernals would be trick.

I finally got my 'Atari Area' back after 20 years. Looking back at the stuff I have done, hardware hacks, terminal programs, utilities, et cetera, the one gaping hole is a lousy game. I say lousy because I don't really have what it takes to polish a game to the point it would be considered good. I think I will set up a system and start pounding out some code just to see if I can make it graphically interesting enough to get inspired.

Rick

Thought I posted a response earlier but it didn't show up. I drop by AA every once in a while but no time to participate. I get too distracted with hankie fights and trivia anyway!<grin>

I really wish Atari would have done GTIA/ANTIC just a bit different. I'm not sure if it would have been feasible but if they had used the 7th bit to enable a 256 character mode instead of going inverse a lot of the games I like would have been possible. Rogue for instance could have been almost a direct translation from the IBM version. The ability to mix text and graphics on the same line would be nice too. As it stands we either have to dip into the ~85 printable characters or make do with 43 redefined characters max.

I kind of dislike the artifacting mode myself. The Ultimas were good games and the graphics were OK but they could have been better. I like the layouts of other games like Pools of Radiance where they mixed graphics and text on the same line. Not that it couldn't be done on an Atari, just that it would be difficult. Ability to switch between graphics 12 and graphics 0 on a line would be trick. Layouts like

********** Semoor Butts 37 hps
* GRAPHICS **** I. P. Freely 27 hps
********** Mild Hy 44 hps
****

w/o having to resort to artifacting and bit mapped modes would have been nice. I think I will give it a hard look.

Rick

4787. Free (just pay shpping) Atari 850

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-08 01:21:08 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e3f3a04$0$2157$742ec2ed@news.sonic.net>
Source record: 576

Forgot I still had this: Atari 850 RS232 (serial port) device, with power adapter & SIO cable. Nicely packed in the box I got it in, when I inherited it from someone or other.

Free... just pay shipping. (I prefer FedEx Ground, but could also do USPS with little trouble, since it's already boxed.)

Email me directly if you want it!

4788. "Control" (Amiga demo conversion) - Wow!

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-08 02:49:54 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e3f4ed2$0$2149$742ec2ed@news.sonic.net>
Source record: 577

Just stumbled upon a video of "Control", a demo by LaResistance released back in December (2010), which is a "conversion" of a mid-1990s Amiga demo.

I'm moving in a week, and my 8-bits are hiding in a box somewhere, but since it's a demo, a video on YouTube is sufficient :) Go watch! It's incredible! (Tons of 3D polygon effects, most a bit more complicated than I think I've seen on the 8-bits so far.)

http://www.youtube.com/watch?v=6OsK4eC6rpg

And compare to the original:

http://www.youtube.com/watch?v=2olrJ7gy3PE

4789. Re: Free (just pay shpping) Atari 850

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-08 04:42:54 UTC
From: bill@newbreedsoftware.com
Message-ID: <4e3f694e$0$2209$742ec2ed@news.sonic.net>
Source record: 578

Bill Kendrick <bill@newbreedsoftware.com> wrote:
> Free... just pay shipping. (I prefer FedEx Ground, but could also do
> USPS with little trouble, since it's already boxed.)

BTW, I looked closer at the box and it's an original Atari one!
Even has a "Dealer Registration Card" stuck to it that's never been taken
off the box.

Sticker on the top left:

A.P.C.D.
390 Caribbean Drive, Sunnyvale, CA 94086

Model No. 850 (stamped)
Contents DON
Qty.

Sticker on right side:

Serial No.
83AHN 201904 (stamped)

Stamped on right:

ATARI, INC.
Sunnyvale, CA 94086

Stamped on bottom (may be box-related, not contents-related, since it's
next to a box certificate stamp):

C-5 183
C016552
UB93787

So if you're a box collector, for whatever reason, this'll be up your
alley. ;)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Entries do not include an email address due to the overwhelming amount of spam that would result.

Internation Reply Coupons

The following is from: (2010.09.12)
http://www.upu.int/en/activities/international-reply-coupons/about-irc.html

About International Reply Coupons
When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country; however, if they are from different countries, the enclosed postage stamp will not be valid.

All member countries
This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. As the service began before the days of airmail, the earliest coupons could only be redeemed for a single-rate ordinary postage stamp to a foreign country. In terms of today's UPU Convention, International reply coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

Mandatory to exchange
The UPU's International Bureau processes several million coupons each year and deals with of all accounting aspects. The International Bureau does not sell IRCs directly to customers; they must buy them from their local post office. Although Posts are not obliged to sell IRCs, it is mandatory for Posts to exchange the coupons. If a Post does not sell IRCs, it is possible to purchase them in a post office located in a neighbouring country.

DISCLAIMER

Appearance in this list does not constitute a recommendation or endorsement of the business, individual, product, or service listed.

Verfications -> YOU!

This list is in a constant state of development, and comes with no

guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Archive-name: atari-8-bit/welcome
Posting-Frequency: 10 days
Last-modified: August 7, 2011

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT
Kept by Michael Current, michael@mcurrent.name

The latest version of this document is posted to these Usenet newsgroups

4797. Re: ATARI SUMMER STAYCATION AND BACK TO SCHOOL FROM BRAVO SIERRA COMPUTERS

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-17 02:40:15 UTC
From: ZerodB <no@no.com>
Message-ID: <m3am47lu5tdc9sdb9jp46vrju54ofudee5@4ax.com>
Source record: 586

That is just uncalled for. Ben is an honest guy. I've done several expedient and honest transactions for quality vintage atari gear with Bravo Sierra.

If you don't like the ads, then for fuck sake, just block him, don't slander the guy. I'd rather see his ads than sporge for DIOR PRADA GUCCI BLA BLA BLA. At least it's on-topic and not vulgar like those ads. I bought machinery because of those ads, and others have as well.

Wondering aloud: Since this group focuses on vintage atari equipment that would place most participants here at least 30 and more likely age 40 and up, why would someone of that age behave as displayed in this post at that stage in life ?

Anyway. I have several machines and carts still running strong that I bought from Bravo Sierra. he's a good guy. This slander is just wrong.

You're wasting your time. Dave U Random, as he usually posts, is a
nutjob. I've seen his stuff in plenty of ng's, but not here before now.
Expect things to get worse.

The stuff's difficult to filter too. Nym-shifting and posting via
anonymisers make it harder to get rid of. :-(

Rule #1 of flaming effectively: flame effectively. This just reads like
it was written by a four-year-old who learned his first naughty words
and is getting as much mileage out of them as he can before the bar of
soap gets shoved into his mouth.

C+ for effort, but a definite F for content.

- J.

4805. Web hits

I follow web hits to the newsgroup. Normally we get about 10-20/hour.
After the last go round of name calling the hits are 17000/33 hours or
550/hour.

Lesson is: If you want a lot a hits to your web sight make sure you
include those posts in your welcome message.

Would be a great master plan since since they could hit google groups
and google has some deep pockets! j/k

Complete outsider to the workings of current Atari but IMHO the
current activity may be directed at keeping their trademarks and
copyrighted logos. I am only familiar with patents and to a much
lessor degree copyrights. My pedestrian knowledge of trademarks is
defend it or lose it. The law may have changed but it makes sense
Atari wouldn't want to go the way of [coke, xerox, aspirin, ... Heck,
I wouldn't want to see Nvidia start putting Atari logos on their video
cards, I'm not sure why though.

There's easy ways around it: Atari could just require you get
permission from them before you use the rainbow Fuji on your web site
or product. Maybe make you add a blurb like <Fuji> used with
permission of Atari Corps. You really don't want people using the
Atari Logo on a shit on a shingle product or even something
questionable like 'abandon ware' carts. They are going to have some
trouble having images removed from the Wayback Machine archive.<grin>

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT

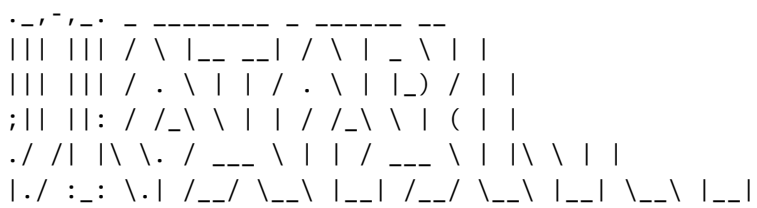
4810. Dear Atari Lawyers:

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-26 06:37:16 UTC
From: John Harbl <jharbl@harbl.com>
Message-ID: <j37eur$p9e$1@speranza.aioe.org>
Source record: 599

Please go eat a big bag of shit.



I've been using your computers and related products since 1981. If you really want to pursue a war with the few remaining people who know what this company once stood for and meant to both them and personal computing in general, be my guest - but all you'll really be doing is alienating those same people who still comprehend that significance. Do you really think some 14-year-old kid scrounging money from his parents to buy what's actually a rebranded Infogrames title puts any stock in the Fuji logo, or the groundbreaking computers and video games that it represents? Of course not.

Get real. We may not own the rights to the company or its intellectual property, but we certainly have more right to use it than you fuckers seem to think we do.

Posted under Fair Use doctrine, so suck it, bitches.

- J.

/* Rambling snipped */

What actually troubles me more is that it becomes more and more
fashionable to try to earn money with lawyers by suing "competitors"
instead of creating useful content or applications.

Dear companies, this type of "business model" is not self-sustaining,
and you will block anyone from inventing or investing anything anymore.

Lawyers don't create values. Engineers do.

Atari is only one of the smaller examples of this questionable movement
in industry nowadays - if you can't do it yourself, block others from
doing. Nice...

And if he's angry with Ben for posting ... His posts are more annoying, they
are irrelevant, Ben at least sells Atari stuff.

4822. SASI to IDE Storage Controller

Newsgroup: comp.sys.atari.8bit
Date: 2011-08-31 04:50:42 UTC
From: Norby <norberto.collado@koyado.com>
Message-ID: <f6789819-300c-4915-a9c8-d19adaeb9800@e34g2000prn.googlegroups.com>
Source record: 511

While restoring my Heathkit H8 computer I designed a SASI to IDE
Storage controller. It uses the SASI bus and the block size is 256
bytes. It uses dual CF cards to allow booting from Drive0 or Drive1.
See the following webpage for details;

http://www.koyado.com/Heathkit/Z67-IDE.html

I was wondering if the Atari uses the SASI bus, and if it does, I will
like to add Atari support to the Z67-IDE if there is interest on it.

Thanks,

Norby

Back in the 80's, I was running a 10meg SASI hard drive for a BBS along
with a 4 meg MIO and 130xe with 2 megs of memory. So long story short,
my answer would probably be YES but if Bob Puff or someone from ICD /
Fine Tooned is still lurking around, they would know the tech better
than myself

Hi Folks,

sorry but i think it was NOT SASI but i think it was SCSI... if i remember
it right i had a BBS exprexx pro with BlackBox en ik think 20 GIG harddisk
later 140 GIG scsi harddisk..

sorry for my 2 cents ;-)

Greetinx from Bernard aka Sysop Bernard ;-)

Your H8 trumps my H89!

Not natively. I believe the first models, vanilla Atari 800, had one or two SASI adapters but they are rare. When the 800XL came out there were ~3 differenent manufacturers of SCSI interfaces.

I read your web page and share your pain. I tried to resurect a bunch of MFM drives w/o sucess this year. Only one that showed life was a 10 meg true IBM full height drive. I had to format it with an ISA MFM card. I have a Xebec controller for it that tested good 15 years ago but haven't hooked the combination up to test. I picked up a old SCSI drive to start sorting through my SCSI controllers to see which ones are good before I plug anything into the Xebec.

Back to Atari, most of the current generation of interfaces are IDE to real or CF drives or serial with SD cards for storage. Anything you do would be well recieved and read for educational purposes but I don't think many people will need to actually have the hardware. One of the manufacturers of a SCSI interface was taking preorders and AFAIK hasn't gotten enough orders in the last year or two to make a production run.

All models of Atari computers came with a built in ttl serial interface to storage. There have been ~7 different people/groups that have used the serial interface with converters to RS232 that use DOS, CP/M, Atari ST, Linux, Windows, and Mac, on their respective hardware platforms. The price for the interface is about $2-6 in parts so a lot of people just went that way. Something like ~3,000 known sales from a single source.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

4836. Seattle Retro-computing Society monthly meeting Sat. Sept. 17th

Newsgroup: comp.sys.atari.8bit
Date: 2011-09-13 04:17:51 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <8b125e3f-5ba3-4661-8bdb-920a3ed510ea@u6g2000prc.googlegroups.com>

Come one, come all, to the Seattle Retro-Computing Society's monthly
meeting, on Saturday, September 17th, 2011!

Do you do any of the following with old computers near Seattle?

+ Use, collect, and/or restore them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," as I expect it will be if you're reading
this
near Seattle, then the SRCS is for you! We exist so you can show off
your awesome stuff, bounce ideas off of fellow enthusiasts, and be
inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor
of vintage machine you prefer! Come on down and tell us about it!

The meetings are graciously hosted by the Living Computer Museum, a
relatively new organization which is building a computer museum in
Seattle's SODO neighborhood. There will be refreshments, a Buy-Sell-
Free-Trade table, and enough table space & power to set up anything
you
may want to show off!

For further details, please see our newly improved web page at
http://www.seattleretrocomputing.com/ and our mailing list at
http://groups.google.com/group/seattle-retrocomp . Hope to see you
there!

(Please note, we usually meet on the fourth Saturday of each month; we
had to move it up a week this month because of schedule conflicts with
retrocomputing events in other cities.)

Gordon "gsteemso" Steemson
SRCS agitator-in-chief

NEWSGROUP BACKGROUND
comp.sys.atari.8bit was created in November 1986 (as part of the Great
Renaming) as a direct replacement for: net.micro.atari8

comp.sys.atari.8bit is unmoderated, and has no formal newsgroup charter.

The comp.* hierarchy of Usenet newsgroups is managed by the Big-8 Management
Board: http://www.big-8.org/

RELATED USENET NEWSGROUPS
alt.binaries.comp.atari8bit
Programs for Atari's 6502-based orphans.

comp.sys.atari.advocacy
Attacking and defending Atari computers.
```

comp.sys.atari.announce
Atari related hard/software announcements. (Moderated)
Moderator: Kevin Savetz
comp.sys.atari.announce web page: http://www.atariarchives.org/csaa/

comp.sys.atari.programmer
Programming on the Atari computer.

Newsgroup: comp.sys.atari.8bit
Date: 2011-09-22 19:47:30 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <19b2b380-3651-4da0-9de5-a65d50a4f717@v26g2000prh.googlegroups.com>
Source record: 533

Just thought I would take a break from getting back up to my Atari hobby to make a couple of corrections if I haven't done them already.

A bit of background: I have a couple of Cybiko hand held PDAs. They were pretty capable systems in their time H8 ~16/32 bit main processor depending on how you define your processor running at 11 mHz. There is a Cybiko Xtreme that runs faster but it doesn't have a built in serial port so it is less interesting for the task at hand. I *THINK* they sold something like 3 million of them and they appear on fleabay for $5-$20 every once in a while.

Pavel Machek wrote a linux sio2pc type program and says he used a 75LS149 for his device. I think this is a typo or misspeak. There are MC1489, MC1489A, SN55189, SN55189A, SN75189, SN75189A but to the best of my knowledge there is no such animal. I think TI did come out with something like a 75LS155 back in the CP/M days but I just can't remember there every being a 75LS149.

Other thing is the 74LS138 in most of the schematics available online is wrong, other then that they are pretty good.

When I took a C programming class it was back in the 80s. Honestly looking at the make files in all their derivations I think they are more sophisticated and more complex then anything C used to be. Sheesh! I am trying to get back up to speed with the Cybiko SDK and think I need to take a class in 'make file programming.' I had the same gripe when working with cc65!

On the bright side I have femul.c compiling for the Cybiko mostly right except for what should be simple stuff like include paths. The Cybiko's default serial speed is 57k so making one work as an Atari sio2pc drive should be trivial. It doesn't mean much for a non expanded device, only ~512 flash and 512k ram, but i have a couple of accessories like 1 meg expansion and mp3 player with a 16 meg SD card. Kind of laughable these days but I think the max SD card you can have is 64 megs. I think the smallest I have in my parts drawer is either 128 or 512 megs so I will probably crash it if I try to use it.<grin>

Been doing some ugly hacking: Tore apart a dead cell phone so I now have a Cybiko running on Li ion batteries. It's only important in that replacement batteries go for about $6 each plus shipping and you need two of them. Seems to be working OK but I really should do some kind of hack to get the voltage levels for charging right.

It's a hobby so I don't have to do something useful. I figure if I get a stock Cybiko that holds a single 88k Atari disk image in the next

year I will call it a win. Anything beyond that will be gravy. Back when i was writing a lot of software my development system was typically just a 720k disk. I should just burn myself a sio2sd device but I am obsessing on the Cybiko for some reason. I will ask on the Cybiko forums is anyone is still around.

Rick

I'm a VERY naiive "Make" user, but about 12+ years ago I got a copy
of "Managing Projects with Make" by O'Reilly. Was pretty useful.
My naiive use is basically:

```
--- begin ---

# Var. for where to install my app
PREFIX=/usr/local

# ... and its data
DATA_PREFIX=($PREFIX)/share/my_app

# Flags to send C compiler. Including a hard-coded (#define) value
# that'll tell the app where to find its data. -Wall turns on 'all' warnings.

CFLAGS=-Wall -DPREFIX="$(DATA_PREFIX)"

# Default make target: build the app
all: my_executable

# Target for installing app and its data
install:
cp my_executable $(PREFIX)/bin/
cp -r data/ $(DATA_PREFIX)/

# Link the objects into the final executable
my_executable: my_app.o some_other_funcs.o
$(CC) ($LDFLAGS) my_app.o some_other_funcs.o -o my_executable

# Create my main object
my_app.o: my_app.c some_other_funcs.h
# Make's default rule is sufficient; it'll come out as:
# $(CC) my_app.c $(CFLAGS) -o my_app.o

# Create object for some other functions
some_other_funcs.o: some_other_funcs.c some_other_funcs.h
# Ditto

--- end ---
```

Or, yknow, something like that. :) There's some insanely clever stuff
you can get Make systems to do, but 99% of the time I just want it to handle
dependencies and take care of some variables.

For example, in the above case, on Linux a:

$ sudo make install

would install it into /usr/local/. But I could easily install it in the
non-local place:

$ make PREFIX=/usr
$ sudo make install PREFIX=/usr

or, like back when I was on a shared Unix (Solaris and SunOS) box in
college, I could tell it I want things to run from somewhere in my homedir.
(Notice I don't need to have root privileges -- no "sudo")

$ make PREFIX=/home/kendrick/opt
$ make install PREFIX=/home/kendrick/opt

I'm rambling. :)

Thanks for the tip, I am downloading Managing Projects with GNU Make,
3.Xth Edition to see if I can be enlightened.

"An implicit rule is either a pattern rule or a suffix rule.
There are built-in pattern rules for C, C++, Pascal, FORTRAN, ratfor,
Modula, Texinfo, TEX (including Tangle
and Weave), Emacs Lisp, RCS, and SCCS. In addition, there are rules
for supporting programs for these
languages, such as cpp, as, yacc, lex, tangle, weave and dvi tools. If
you are using any of these tools,
you'll probably find most of what you need in the built-in rules. If
you're using some unsupported languages
such as Java or XML, you will have to write rules of your own."

This could take a while.

It's where I live. :) I feel like Rip Van Winkle. When I was last
awake I could go to Fry's to pick up some EPROMs and a bag of Doritos.
Went there yesterday and they had squat EPROMs but you could still get
a bag of chips<sic>. They had a stack of 6821's but the price was
double everyone online. I was thinking of trying to keep my SDX 4.19
ROM as is just in case something goes wrong when I burn 4.22 but the
nearest place to get a 27C512 is a 20 mile drive. I have an old 386sx
working motherboard I am trying to tell myself I should pull parts off
of. It was a back up position but my new EPROM burner seems to be
working OK.

BTW: I did get Puppy Linux burned into a CD and it worked well.
Unfortunately all the laptops I fixed went back and I left the CD in
one of them. Hard times: Woman I fixed them for took them all
including the one I was supposed to get to keep to sell for cigarette
money! Ah, life is but a joke.

I can't find a 74LS149 in my data books either. I made several
different designs, 74LS00, 4049, et cetera. Just about any inverting
logic or amp will work.

I guess it isn't a big deal: Everyone left probably already has one of
[sio2pc, sio2usb, sio2sd, sio2ide, emulator, ...]

Actually, no. I don't. OTOH, my 130XE hasn't been used for quite a few
years. Lack of space, TBH. However, I hope for that to change soon(-ish).

I'm begining to wonder if I was every as good as I think I was. I finally pulled the tags off my SDX ROM and it turns out it was a OTP type w/o a window! I have version the 4.21 binary and didn't have version 4.22. If I understand it only had code changes to detect a 65C816 processor and switch to FTE as the copyright holder. Correcting my post about corrections!

I'm real slow coming back up to speed. For the last year or so my Atari has been a gypsy system that I set up in front of the TV or 1702 monitor. Its been hooked up via sio2pc to half a dozen different clones and laptops. I had it hooked up to my ATR8000 for a while but SDX never played nicely with it: IIRC the time out is set way too short in SD so you hear the babbling sio sounds a couple of times before the built in head load delays in an ATR8000 start to read. I may have to look into that...

Anyway, after 20 years of significant others who treated my Ataris like an infectious disease I finally have a bit of tolerance with space for a table and an LCD monitor somewhere other then a flooded basement. Really feels good!

Found out the hard way there is no such thing as a 28 pin 512k flash but that 386sx motherboard died for a good cause. Built a monitor cable, still have 2-4 flavors of sio2pc cable laying around. Fatih Aygün has a new sio2pc type Windows software AspeQt with high speed

routines. I still do have a small footprint PC running Windows XP embedded with a fresh 10 gig CF I put in it last week to compliment its 512 meg boot CF. That Puppy Linux Bill pointed me to can install to a USB thumb drive so I even have a back up position. My old Dataerase is taking an hour to erase an EPROM but there are a bunch of <$30 ones on fleabay. Life is looking good.

Wow, this kinda surprised me:

Alternate Reality, M.U.L.E., Paradroid Coming to iOS
Sep. 23, 2011
http://www.macworld.co.uk/ipod-itunes/news/index.cfm?newsid=3305580

British developer-publisher Elite is resurrecting a variety of classic games for iOS

Following a successful range of ZX Spectrum rereleases on iOS, long established UK developer-publisher Elite Systems is turning its attention to a variety of computer games from other 8 bit computers such as the Commodore 64 and Atari range.

Nine standalone iOS conversions are set to hit the App Store for 59p each on an as yet undecided date -- three of these will be of US origin, three from the UK and three from Germany.

The American games include Datasoft's action adventure Black Magic from 1987; Ozark Softscape's fantastic multiplayer strategy game M.U.L.E. from 1983; and the immensely ambitious open world freeform RPG Alternate Reality: The City from 1987.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

I wonder if they actually got the 'rights' to do this. I hope for clear sailing anyway with a few improvements. At this stage in CRPG development things have been dumbed down so much I suspect The City will become a much friendlier place. I played it on 3 platforms, [ST, IBM, 8bit] and found the first two much easier to play. They implemented features that were left out of the original 8bit version like being able to get a job which made starting a character much easier. Just being easier wasn't enough to make me like them as much as the 8bit version. Heck, I have a Windows Mobile phone anyway and if I did switch my first choice would probably be some flavor of Andriod.

Rick

You know what I would find hilarious - new Infocom style works of Interactive Fiction. Completely impossible on anything iPhone/Android-phone sized, unless you like pain. :D But that said, after pulling out of doing an Atari Exhibit at this year's Vintage Computer Fest Midwest for having a car accident 2 days before the show, I showed up and ran games (well, sort of) with the Atari800 emulator on my AT&T Inspire...

I plan on having a 'Retro Gaming Night' with my grandkids. They
actually love the simple stuff like Frogger or River Raid more then
the latest-greatest 3d stuff that they can't figure out.

The tech to bring out video from a device based on an ARM processor as
NTSC is mature. I've had a couple of different 'personal media
players' that had it in addition to their built in display. If my
provider had a phone available with composite out I would buy it in
heart beat. Something like an Android with composite video and J/S
ports would be hot. As it is, I will be lugging a 130XE and monitor to
my grandkids.

In the mean time I am leaning towards buying http://www.sparkfun.com/products/10329
just because. Seems like on its lowest level you could run an Atari as
a term and be able do some simple stuff like [80 column term, storage,
mp3 player]. Save a couple of bucks over doing it just about any other
way. It seems like the device isn't hugely popular but anything done
with it could be ported to any computer using serial I/O.

Rick

4863. Free (pay shipping): Atari 810 disk drive, 1010 tape drive, some manuals & some cassettes

Unclear what works, or if any of it doesn't work, but it's free if you
pay shipping! I'd prefer to send it all as one big package, of course.

* Atari 810 Disk Drive:
* A/C
* SIO
* Blank(?) disk ("Atari Formatted Diskette II" :^)) [in "Diskette Holder"]
* Manuals:
* "The Atari 810 Disk Drive: An Introduction to the Disk Operating System"
* "The Atari 810 Disk Drive: Owner's Guide"
* "Disk Operating System II: Reference Manual"
* "Inside Atari DOS" [Bill Wilkinson, OSS, Inc.; Compute! 1982]
* Atari 1010 Tape Drive:
* A/C
* SIO cable
* Info sheet
* Cassettes:
"Andromeda Conquest" (Avalon Hill) [in box, with manual]
"Cytron Masters" (SSI) [no manual]
"Stellar Shuttle" (Broderbund) [no manual]
11 other tapes (various BASIC & bootable games) [in a 12-cassette case]

Email me privately if interested! First-come, first-served!
(Payment for shipping via PayPal is fine.)

Let me know how that card works! I've got a funky little setup at home
with an SD-card reader built into an old XM301 case, and an Atari 8-
bit monitor out to ST monitor converter box that I had someone custom
build for me, so everything on my desk has an Atari logo on it.....
Vince Briel has made an adapter board that can plug into Apple][s and
read MP3s from a flash drive, along with a player program. (
http://www.brielcomputers.com/wordpress/?cat=14) I wish I had the
know-how to re-adapt this for Atari 8-bit computers, as an SIO or PBI
device....

The rights are one thing, and the technical aspect another. I'm not aware that any retro-programmer or hacker or pirate ever actually successfully "broke" AR: C's subtle and multi-leveled copy-protection screen. I remember someone was working on a flashcart with "save" function, but I'm not aware (and I do check periodically) that that was accomplished.

IIRC, there was a particularly devious copy-protection fall-back in AR that would only present itself after one'd played his or her partially-cracked version for an hour or so.

Software publisher Elite has the wherewithal to accomplish this I suppose, but I hope I hope they don't accept the inferiority of one of the AR:C ports, such as ST or PC or Amiga.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

Oh this is cool news!! I am glad the classics continue to find new
life. I remember when I first saw MULE on the Atari (loaded off a PC
in the 80's.. that was amazing to me) and just thought the game was
funny! Hopefully people today will get a new blast with it.

Heck, might even be another Angry Birds for the iPhone users. :)

Whoa, sounds pretty good actually. I have always liked the idea of
running a SIO2PC like device off something about the size of a
Portfolio, so this would be interesting to see.

Yeah. we moved to a new City 260 miles away and we thought it was time
for a change to something a little less hokey sounding. =)

4876. Atari 8-Bit Computers: Vendors and Developers

------------------------------

Subject: Introduction
```

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Entries do not include an email address due to the overwhelming amount of spam that would result.

Internation Reply Coupons

The following is from: (2010.09.12)
http://www.upu.int/en/activities/international-reply-coupons/about-irc.html

About International Reply Coupons
When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country; however, if they are from different countries, the enclosed postage stamp will not be valid.

All member countries
This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. As the service began before the days of airmail, the earliest coupons could only be redeemed for a single-rate ordinary postage stamp to a foreign country. In terms of today's UPU Convention, International reply coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign

country.

Mandatory to exchange
The UPU's International Bureau processes several million coupons each year and deals with of all accounting aspects. The International Bureau does not sell IRCs directly to customers; they must buy them from their local post office. Although Posts are not obliged to sell IRCs, it is mandatory for Posts to exchange the coupons. If a Post does not sell IRCs, it is possible to purchase them in a post office located in a neighbouring country.

DISCLAIMER

Appearance in this list does not constitute a recommendation or endorsement of the business, individual, product, or service listed.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

From
http://www.faqs.org/faqs/usenet/posting-rules/part1/
Announcement of professional products or services on Usenet is
allowed,
provided suitable restraint is exercised. Since someone else is paying
the phone bills for this, it is important that it be of overall
benefit
to Usenet. One of the few groups where such information is
appropriate
is comp.newprod. comp.newprod is a moderated group; you can get the
submission guidelines from the article "Welcome to comp.newprod",
posted
periodically to comp.newprod and news.answers. You can also get this
article by sending a mail message to mail-server@rtfm.mit.edu with the
single line:
send usenet-by-group/news.answers/newprod

If your posting is really relevant to some other newsgroup,
particularly
one of the *.announce newsgroups, you may consider posting it there;
some
moderators allow product announcements in the *.announce newsgroups.
e.g.
an announcement about an Amiga product could go in
comp.sys.amiga.announce. Before you post any such announcements, make
sure that you carefully read all of the administrative documents for
the
group. Also, read the regular messages in the group itself for at
least
a week to make sure that your announcement is consistent with what
other
people post. Of course, this is true for *any* post, but especially
true
for commercial announcements.

General guidelines: Clearly mark your article as a product
announcement
in the subject. Never repeat these -- one article per product at the
most; preferably group everything into one article. Advertising hype
is
especially frowned upon -- stick to technical facts. Obnoxious or
inappropriate announcements or articles violating this policy will

generally be rejected. This policy is, of course, subject to change
if
it becomes a problem.

There exists an alternative hierarchy called "biz" specifically for
commercial postings. See the articles "Alternative Newsgroup
Hierarchies,
Part ...", posted periodically to several newsgroups, including
news.lists.misc. You can also get these articles by sending a mail
message
to mail-server@rtfm.mit.edu with the lines:
send usenet-by-group/news.answers/alt-hierarchies/part1
send usenet-by-group/news.answers/alt-hierarchies/part2

I would suggest we delete all references in the Atari faq to vendors
who don't follow the posting guidelines. Do I have a second?

Rick

I disagree with Rick - there are very few vendors of Atari merchandise, and so I tend to have the rationale that these "commercial" posts are ON-TOPIC. I assume you are going after Ben here, he posts up to 3 posts at a time, and yoiu can always ignore them, or kill-file him.

I have to laugh at the reference in the guidelines posted regarding "Someone else is paying the phone bills for this" in this day and age, I would imagine that MOST people are not on dial-up - don't start a war about it - when the guidelines were written, most people WERE on dial-up, so that statement is relatively irrelevant.

IF you are referring to Ben and Bravo Sierra, I like to know that there is at least one person out there still supplying the Atari market. I know there are a couple others KJ MANN (whatever) and AtariAge (again, whatever.)

Leave the vendors alone - they are hardly making a killing supplying old Atari stuff - mostly a labor of love, I would imagine. (After all, I paid almost $1,000.00 for my Atari 400 and asssorted keyboard mods, drives, and software back in the day - now you can pick this stuff up for a song...)

Now, if a vendor starts firing off hundreds of messages, or is a fraud - then for sure, remove them or maybe even make of note of their transgressions in the FAQ so people don't get suckered, but delete them?

Brings to mind Stalinist Russia, where your family name would be removed for transgressions against the state.

Anyways, what happened to tolerance, and freedom of speech??!

Just my $0.02

Agent D.A.D.

Heck, don't limit it to Ben, he seems to be a candidate for the most
obvious otherwise you wouldn't have noticed him right?

Reread the post, specifically the part: "Also, read the regular
messages in the group itself for at least
a week to make sure that your announcement is consistent with what
other
people post. Of course, this is true for *any* post, but especially
true
for commercial announcements."

Show me a list of people in the last 15 years that have done it. I've
been here that long and can't recall that many.

I live in the country and I am on dial up. The only thing that makes
the newsgroup readable is a kill file. Every once in a while I check
in with my smart phone and see 3/4ths of the messages here are Ben's
spam.
>

It is really looking like you didn't even read the title of this
thread or its content. IT IS A VENDOR LIST!
>

I say commercial vendors that don't follow guidelines and/or spammers
should leave the newsgroup alone.

Heck, people can spam if they want. Hows that for freedom of speech. I
just say if someone is a known bad actor, kick them off the FAQ
vendors list.
>
> Brings to mind Stalinist Russia, where your family name would be removed for
> transgressions against the state.

Oh please, we aren't killing 30 million people here, just saying
remove known spammers from the FAQ vendors. I will expand the list of
what it takes to get off the list if you like.
>
> Anyways, what happened to tolerance, and freedom of speech??!

We have to agree to disagree then.

Start a poll on Atari Age and I will not vote but go with the
majority.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from 1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit family of computers are owned by Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France. http://corporate.atari.com/

4887. Chu Chu Rocket clone; C code

Newsgroup: comp.sys.atari.8bit
Date: 2011-10-25 20:27:38 UTC
From: bill@newbreedsoftware.com
Message-ID: <4ea71bba$0$1732$742ec2ed@news.sonic.net>
Source record: 376

My son's been playing a lot of Chu Chu Rocket on our Sega Dreamcast, and I enjoy the puzzle mode of the game (vs the fast-paced multiplayer arcade mode).

Basically, you have a tile map with some walls between tiles, one or more mice, zero or more cats, one or more rockets (goals), zero or more holes.

The objective is to get all of the mice into one of the rockets, and avoid cats and holes -- you lose the puzzle if you lose just one mouse. Cats can go down holes, and will stop bothering you.

What makes it tricky is: the mice and cats both just walk straight ahead until the bump into a wall, at which point they turn clockwise and continue. But if there's a wall to their right, they'll go left instead. And if there's a wall on both sides (e.g., a] shape), they'll go back the way they came.

So, to get the mice to the rockets, and in such a way as to avoid cats and holes, you have a few directional-arrows you can place on the map before you put things into motion. Which arrows, and how many, depend on the particular puzzle.

The original game has a puzzle editor, and when you're creating a puzzle, you put down the arrows necessary to complete the level. When you play that puzzle, those arrows appear in a list of "Available panels", rather than on the grid itself, obviously. :)

The game was released for GameBoy Advance back in the early 2000s, a few years after the original Dreamcast release. It looks like it was released for iOS (iPhone, iPad) about a year ago. (I only discovered yesterday!)

I've been thinking of making a puzzle game based on these simple rules for the Atari 8-bit (but not planning on using the same name or theme, since copyright and trademark holders dislike that). To start out, I did a simple C-based terminal version under Linux. It's pretty clunky; it uses scanf() to read a string of text. When the game is in motion, you just hit [Enter] over and over again, and it draws another ASCII rendering of the map, with the cats and mice in their new positions, plus any stats info. :)

Here it is:

http://www.sonic.net/~nbs/chuchu-20111024.tar.gz

My idea for the Atari 8-bit would be my Super IRG text mode (flickering between two fonts, but just one color palette, in multicolored text mode; it'll give me about 13 colors to use).

The grid is 12x9, and if I were to do 2x2 tiles of characters (giving me
8x16 pixels per tile), I need 18 rows of at least 24 characters each.
I could use narrow mode (32 characters) and fit things easily.

Furthermore, I was thinking the map itself could be drawn as 9 rows of 24
characters, and then repeat each row, using another (pair of) font(s).

In other words, in memory, it'd look like:

```
ABCD12CDABCDABCDABCDABCD
CDAB34ABCDABCDABCDABCDAB
ABCDABCDABCD12CDABCDABCD
BCABCDABCDABCDABCD34CDAB
```

etc. But on screen, it would be twice as high;

```
ABCD12CDABCDABCDABCDABCD
ABCD12CDABCDABCDABCDABCD
CDAB34ABCDABCDABCDABCDAB
CDAB34ABCDABCDABCDABCDAB
ABCDABCDABCD12CDABCDABCD
ABCDABCDABCD12CDABCDABCD
BCABCDABCDABCDABCD34CDAB
BCABCDABCDABCDABCD34CDAB
```

and, using two fonts, one for even rows, one for odd, it could render
tiles like:

```
##../\..##..##..##..##..
##..\/..##..##..##..##..
..##}{##..##..##..##..##
..##^^##..##..##..##..##
##..##..##../\..##..##..
##..##..##..\/..##..##..
..##..##..##..##..}{..##
..##..##..##..##..^^..##
```

In other words, in one font (used on even rows: 0, 2, 4, 6, ...),
"AB" would be the top half of one shape. But in the other font
(used on odd rows: 1, 3, 5, 7, ...), "AB" would be the bottom half of
that same shape.

In the end, it means I'm using 32 x 9 = 288 bytes of memory for screen
data. (That means 1/2 as much effort to draw the board every frame!)

Using standard fonts (no flickering), it'd be 2024 bytes of memory,
1K for the even rows, 1K for the odd. Using flickering mode, it'd be
4096 bytes.

Then there'd be the bloat from the Display List, to get the lines to
repeat. (Row 0 of screen memory on screen twice, then Row 1 twice.)
Plus the DLI to get the font to switch between rows (Row 0 on the screen
is Row 0 of screen memory with Font A. Row 1 on the screen is Row 0 of
screen memory again, but now with Font B. Row 2 on the screen is Row 1 of
screen memory, with Font A again. etc. Have I made my point, yet? :))

Since I don't do assembly, and BASIC would be too slow (even TurboBASIC XL probably would be), and since my original code is in C (and yes, it could 'optimized', now that I've got the logic basically figured out), my target language for this is Action!

Unless, of course, someone else wants to make the game. :) One big task will be doing the graphics. I have my SuperIRG font editor, but I'd need to manually account for the dual fonts between rows, since it doesn't.
(Not that I didn't come up with this idea, as a useful trick for high-color, graphically complicated tiles for puzzle games, years ago!)

Knowing me, I'd probably do the art in Gimp on Linux, and then whip up some tool in C to convert it to 4KB of Atari font data...

4888. Glacial pace 4d Picaso work

Newsgroup: comp.sys.atari.8bit
Date: 2011-10-28 18:34:13 UTC
From: ricortes <ricortes@earthlink.net>
Message-ID: <799a0c92-b767-43bb-b577-f041e6f3f68e@h5g2000vbf.googlegroups.com>
Source record: 377

Don't get me wrong, life is good. Spent the weekend in Pacific Grove
with my SO, babysitting my grand kids 2-3 days a week. I'm really
slowing down.

As I said<?> I bought one of these puppies from Sparkfun.
http://shop.4dsystems.com.au/vga-embedded-vga-graphics-modules/295-9005.html

http://www.4dsystems.com.au/downloads/Semiconductors/PICASO-GFX2/Docs/PICASO-GFX2-DS-rev1.
pdf
Got it up and running, pretty nice display on the LCD VGA display I am
testing it with. I haven't tested it with any of the options like uSD
card or hooked the audio output up yet.

There's some things on my wish list that the device won't handle, for
instance it only plays mono audio WAV format files. IMO it would be
much nicer to have stereo and some kind of compressed format like MP3.
Heck, you can have 2 gigs of MS style file format and 2 gigs of RAW
sector I/O so that should be enough for several hours of easy
listening. It almost makes sense to me in that the sound will be
generated as a co-processor. For something like Dungeon Master you
would just tell it to play the clanking sound of the door then proceed
with the game logic with the existing processor.

I sweat details like should I hook it up through a joystick port like
the ill fated XEP80 or just hang it on the SIO buss. It does has the
ability to read 8 bit port data but as soon as you start talking about
popping the hood of an Atari you eliminate 80% of the people from
using it. I understand that they are selling these puppies for ~$50 so
they can't give $200 in support but I asked simple questions on both
Sparkfun and the 4d web sites and didn't get an answer. I am leaning
towards attempting to make it a SIO device. After reading through ~13
megs of PDFs I think it may be able to survive on the serial buss with
other devices. Even if it doesn't it will work as the one device you
should have. Here's my hit list of what it should be able to do:

Alternative to all SIO devices like SIO2PC, SIO2SD. Best sound quality
sound device available vs. 2nd POKEY or COVOX if you can find one.
Replacement for XEP80 sans printer port. It would make a nice upgrade
for stuff like the John Harris cable TV information channel. Great
static picture viewer with 16 bit color depth. Lot of bang for just
over 50 bucks.

They have a number of demo apps for it like a version of Tiny BASIC
and a few games like PONG/Breakout.
http://www.youtube.com/watch?v=vWKWQcfNd3Y

The system comes up with ~14k free memory before loading apps and something close to that in slower FLASH. Should be plenty for anything I want to do.

Only buyer's remorse I am having is they want $20+ for the programming cable. I'm not sure it is even necessary but I will try to find a work around.

Rick

1) Friendly, honest, helpful and fast with service! 2) Very Knowlegeable of Atari products & skilled at helping customers choose the items that best meet their needs. 3) The inventory changes regularly and often there are many hard to find items that are unavailable anywhere else. 4) Prices are usually less than on auction sites. 5) Very huge and alphabetically sorted lists of Atari items (OLD and NEW). 6) Ordering is very easy, no dozens of clicks on several HTML pages, just read and then copy+paste the ASCII text into your e-mail to order anything. 7) I avoid making promises I cant keep! 8) Ben's Benevolent 24 Hour Help HotLine And Voice Mail! Call Any Time, Any Day!If I Dont Answer, I'll Call You Back, Even Long Distance! Just Leave A Message With Your Phone Number & Best Times To Call Within Pacific Standard Time (PST) And I'll Call You Back! And Remember, If You Dont Leave A Message, I Cant Return Your Call!

Questions? You can E-Mail me or ask other Atari Users. You probably know 1 or 2 who bought from me. Quite a few have over the Years! (503)256-9974.

Posting-Frequency: 10 days
Last-modified: August 7, 2011

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

4899. FS: Atari 65XE 130XE 800XE 600XL 800XL 1200XL TV Scart A/V Cable

Newsgroup: comp.sys.atari.8bit
Date: 2011-11-12 17:42:14 UTC
From: Oge <oge@nospam.it>
Message-ID: <4ebeafbf$0$1375$4fafbaef@reader1.news.tin.it>
Source record: 388

For sale, an unique TV Scart Cable which embraces a large range of Atari Home Computers.
It carries Composite Video + Stereo (Mono signal being doubled to both L/R channels at the Scart Connector) and it's internally sealed against traction.

The quality of both Audio and Video is truly higher, another world if compared to the common RF lead. Such Cable will even work with modern (LCD) TVs.

Compatibility List:
. Atari 65XE
. Atari 130XE
. Atari 800XE

. Atari 600XL
. Atari 800XL
. Atari 1200XL

. Atari 800

Link: http://cgi.ebay.it/ws/eBayISAPI.dll?ViewItem&item=170727861638

Cheers,
Oge

4900. Atari 1050 happy drive

Newsgroup: comp.sys.atari.8bit
Date: 2011-11-12 21:17:35 UTC

1) Friendly, honest, helpful and fast with service! 2) Very Knowlegeable of Atari products & skilled at helping customers choose the items that best meet their needs. 3) The inventory changes regularly and often there are many hard to find items that are unavailable anywhere else. 4) Prices are usually less than on auction sites. 5) Very huge and alphabetically sorted lists of Atari items (OLD and NEW). 6) Ordering is very easy, no dozens of clicks on several HTML pages, just read and then copy+paste the ASCII text into your e-mail to order anything. 7) I avoid making promises I cant keep! 8) Ben's Benevolent 24 Hour Help HotLine And Voice Mail! Call Any Time, Any Day!If I Dont Answer, I'll Call You Back, Even Long Distance! Just Leave A Message With Your Phone Number & Best Times To Call Within Pacific Standard Time (PST) And I'll Call You Back! And Remember, If You Dont Leave A Message, I Cant Return Your Call!

Questions? You can E-Mail me or ask other Atari Users. You probably know 1 or 2 who bought from me. Quite a few have over the Years! (503)256-9974.

It has the ~equivalent of a 15 bits of I/O pins. From what I gather
not a lot of people are using it as a parallel device. Most seem to be
like me, still fumbling around with getting the serial to work.

If I sound confused, it is because I am. What I *THINK* this
documentation covers is the basic FPGA with its soft core 16 bit
processor.
http://www.sos.sk/a_info/resource/c/4Dsystem/PICASO-GFX2-DS-rev1.pdf

BUT what I bought was a development/stand alone/embedded board that
doesn't have all the pins brought out.
http://www.4dsystems.com.au/prod.php?id=149

So even though the processor has 2 com ports only one is brought out.
Ditto for I2C port; there but not brought out.

The programmers reference I am reading from is over 300 pages. I
figure if I learn a page a night I am just about senile enough to
forget it as fast as I read it.<grin>

I'm really in the woods here. I don't have their programming cable yet
but I am under the impression on start up it looks for an autorun
script on the uSD card. I wrote a test script and put it on the uSD
but haven't booted the thing with it installed yet.

I'm asking myself a lot of why(s) as I work with it. I love the size,
about as big as a match book, but hooked to a VGA monitor it loses
some of its size advantages. I also ask myself 'why not just do the

same thing with software on a full PC?" I could imagine games and apps running on an Atari but dumping commands like playing a WAV file to a PC but at some point it loses a bit of purity if that is the right word.

Heck, under the hood of an 8bit with 4gigs of uSD, the VGA connector coming out the back, and the ability to play WAV files would make it worth it.

Rick

4910. FS: Heavy Duty Power Supply for Atari 65/130/800XE, 600/800XL and XE Game System

Newsgroup: comp.sys.atari.8bit
Date: 2011-11-16 12:30:42 UTC
From: Oge <oge@nospam.it>
Message-ID: <4ec3acb3$0$1382$4fafbaef@reader2.news.tin.it>
Source record: 399
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

For sale, X3 Heavy Duty PSUs which will work with the following Atari machines:

. Atari 65XE
. Atari 130XE
. Atari 800XE

. Atari 600XL
. Atari 800XL

. Atari XE Game System

Being its amperage even far higher than the most power-hungry of the above Atari Home Computers, this Heavy Duty Power Supply will work flawlessy in every situation. This includes modded and/or expanded Atari machines.

Link: http://snipurl.com/2ox69c (Only few units available)

Cheers,
Oge

eye am sofa king re tod did

This growing old thing is rough. My OCD used to pull me through rough spots when normal people would have given up.

The documentation said I could run scripts from a uSD card installed on the board. I spent about 4 hours writing scripts, trying to use demo scripts, reading the web site, reading the documentation, nothing worked. I was thinking scripts would be ASCII text type files similar to batch files. I was thinking wrong, the device only supports compiled scripts! Everyone seemed to get this but me.

Punch line to this is people don't need to buy the ~$26+ shipping cable to program the device.

It's a pretty simple process, just load the free 4d Workshop, write a script, hit the compile button. This will produce a file ABC.4dScrpObj where ABC is the name of your source file. Copy this to a fat 16 uSD card as autoexec.4ds uSD and insert it in the Picaso, on booting the Picaso the program will run.

I'm not sure where I will go next but I want to start checking serial functions. I am 99% sure I can just use a bilatteral switch or 3 state buffer to isolate device on the Atari serial buss should the need arise. I am thinking I may want to look at the joystick port with the old MPP serial handler or hack the XEP80 handler to work with it. Eventually I would like to have it on the serial buss if I can work out the details but I have to make sure I can make it run at 19k BAUD from internal software. Docs say it expects a command i.e. 'u at 9600 BAUD as an autobaud command. I'm pretty sure I can just write a program to set the default to the right figure. Goal is still to use it as a cheap HD and XEP80 replacement that plays nice with other stuff on the buss. Worst case is it ends up being the only thing that can be plugged into the buss.

Rick

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

4917. Seattle Retro-Computing Society meets Sat. Nov. 26th

Newsgroup: comp.sys.atari.8bit
Date: 2011-11-22 22:53:42 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <154aa950-a770-4c79-a35c-a395b3d744a6@d37g2000prg.googlegroups.com>

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.ti,comp.sys.m6809,comp.sys.m68k

Come one, come all, to the Seattle Retro-Computing Society's monthly meeting, on Saturday, November 26th, 2011! You don't want to miss this one -- it's our last meeting until January 2012.

Do you do any of the following with old computers near Seattle?

+ Use, collect, and/or restore them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," as I expect it will be if you're reading this
near Seattle, then the SRCS is for you! We exist so you can show off your awesome stuff, bounce ideas off of fellow enthusiasts, and be inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor of vintage machine you prefer! Come on down and tell us about it!

Please note that, as it would fall on Christmas Eve and no one would attend, we will not be meeting in December. If you miss this meeting, you won't get to see everyone (and their nifty stuff) again until January.

The meetings are graciously hosted by the Living Computer Museum, which
is gradually fitting out a computer museum in Seattle's SODO neighborhood. There will be refreshments, a Buy-Sell-Free-Trade table, and enough table space & power to set up anything you may want to show off!

For further details, please see our web page at http://www.seattleretrocomputing.com/ and our mailing list at http://groups.google.com/group/seattle-retrocomp . Hope to see you there!

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

4923. Tracker recommendations?

Newsgroup: comp.sys.atari.8bit
Date: 2011-11-30 07:11:23 UTC
From: bill@newbreedsoftware.com
Message-ID: <4ed5d71b$0$1726$742ec2ed@news.sonic.net>
Source record: 462

The band 8 Bit Weapon has finally added an Atari 8-bit to their line-up (C=64, Gameboy, Apple II, etc.), and I mentioned to them that they should try Syn as a way of doing live music.

They asked if I could send a floppy with it, and I rounded up a pair of spare 5.25" disks from a distant in-law. So I've got room to throw in a few more music apps. What do people recommend? I'm especially interested in music composition / tracking software. What's what? What's good?
I never did get into composing music on the Atari, because I'm not musically inclined. :-/

http://ftp.pigwa.net/stuff/mirror/ftp.spudster.org/pub/Atari/CTH/Audio/AMP/

amp1.zip is the 8 bit version while amp3 is for the ST.

In the zip is COMESAIL.AMP<separately in the directory too> which is
my all time favorite tune on the Atari. All the data is packed as a
zip archive so you may have to make an .atr out of it.

I've forgotten the relationship between AMP and AMS, I think AMS came
first and Philip Price complained about the naming so Steve Lashower
changed to AMP.<?>

It may not be the best but since you can convert/use AMS files AMP has
the most tunes available.

Rick

4928. December 2011 Prize Giveaway!

Newsgroup: comp.sys.atari.8bit
Date: 2011-12-02 09:28:02 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <4ed89a22$0$13484$bbae4d71@news.suddenlink.net>
Source record: 467

Greetings everyone!

Lets start the Holidays off right!

At this time, The DarkForce BBS is resuming its monthly prize
giveaway.

Here is December's prize:

December 2011:
1. Atariuser Magazine - some lucky Atari caller will win a free
12 issue/1 year subscription to this great magazine (PDF).

Just telnet to "darkforce-bbs.dyndns.org"

The BBS software will automatically log your call, but please
go into the prize section and confirm that you want to be placed
into the random drawing.

Good luck to this months callers!

:)

PS Note that the winner will have to provide a valid e-mail
address for prize delivery.

4929. We are down... :(

Newsgroup: comp.sys.atari.8bit
Date: 2011-12-06 00:58:16 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <4edd68a8$0$15508$bbae4d71@news.suddenlink.net>
Source record: 468

Folks, for the moment, the DarkForce BBS is offline.

I'm now sure what's going on. I've been working on it
for the last 3 hours with no success. The board is up
and running. I can logon locally at the Mega ST itself.
I can logon to the BBS from any machine on my local
LAN. I can not logon from any outside source.
I rebooted everything, cablemodem, router, Mega ST.

I logged into dyndns.org and checked my account there
They are showing my current IP address. So the daemon
I use on my Kubuntu box is working. I called Suddenlink
and asked them if they had added any ports to those
they already block. Nope. Port 23 is still open. I logged
onto my UDS1100. All settings look normal. I logged on
to my Router, checked the port forwarding - it all looks
like its supposed to, all port 23 requests are forwarded
to the UDS1100/Mega ST's LAN address of 192.168.0.104.

I can ping that address, no problems there.

So at this point I'm scratching my head...

I'll keep working on it and will let everyone know if/when
its back up.

Sorry for any inconvenience!

4930. Back up...

Newsgroup: comp.sys.atari.8bit
Date: 2011-12-06 14:57:15 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <4ede2d4b$0$15367$bbae4d71@news.suddenlink.net>
Source record: 469

Okay, I finally managed to squeeze enough time in to replace our old Dlink router with a new Linksys.

I just used a remote access terminal and I was able to logon to DarkForce okay.

Everyone just lemme know if you have any more problems. Keeping my fingers crossed that this was it.

Really odd - the Dlink was working in every single aspect, except that it was apparently failing to forward
any ip address requests.

Thanks! :)

PS Now I'm off to the mall with my wife.... the fun just never ends. :D

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

4935. First assemble

Newsgroup: comp.sys.atari.8bit
Date: 2011-12-11 17:41:35 UTC
From: bill@newbreedsoftware.com
Message-ID: <4ee4eb4f$0$1654$742ec2ed@news.sonic.net>
Source record: 474

So it wasn't until recently (inheriting someone's big collection of 8-bit stuff) that I had an honest-to-goodness book on assembly language for the Atari. I also inherited an Atari Assembler Editor cart.

I was a bit weepy last night. For the first time, after all these years of hacking on my Ataris, I typed in a little assembly language program, assembled it, and ran it.

I was a bit spoiled by BASIC, then TurboBASIC XL and Action! But now that I'm looking at whipping up my own DLIs and VBIs, I'm finding paper + POKEing to be a bit tedious & bug-prone. :)

With so little free time, and less coming (new baby in January!), I doubt I'll get far, but I just wanted to share my door-opening experience.

Probably old-news to all you hackers who've been assembling stuff for 30+ years. :^)

PS - Should I bother grabbing a copy of MAC/65+DDT? I see that AtariMax has a 'reissue' version for only $25. I also know there are many, many disk-based assemblers out there that folks use.

PPS - Oh, and I discovered a MAC/65-based cross-assembler that can run on Linux. Maybe between that and poking around at CC65, I could build stuff on this newfangled laptop. Too bad the keyboard absolutely sucks, esp. compared to my 1200XL. ;)

$.02

It is a fine assembler for getting your feet wet. At some future date
you may want to change.

The other options for assembler are stylistic: It is subjective based
on how you like to work. Some people go macro crazy and others such as
myself just don't use the feature.

A macro example from Mapping

```
.MACRO MOVEWORD
LDA %1
STA %2
```

```
LDA %1+1
STA %2+1
.ENDM

.MACRO MOVEBYTE
LDA %1
STA %2
.ENDM
```

If you are really into BASIC or Action! keywords you could name the above PokeC and Poke respectively. In use you would have a file with your predefined macros and include it in your assembly program. There are problems in that you have to essentially write your own keywords, remember the exact syntax, and have the files on your work disk.

Heck, I got used to the Atari ED/ASM. It takes so freaking long to compile, I would write code for an hour or so between compiles then make myself a sandwich while it chugged away on the compile. The debugger on it isn't so hot so I would use OMNIMON instead. SOP, write a ton of code, save to disk, compile from disk, go eat a sandwich, come back, fix errors, compile from disk, bathroom break, run program, crash, use OMNIMON to figure out what I did wrong, rinse and repeat.

I was probably among the first to defect to cross assemblers. I had a Tandy 1000tx which was an 8 mHz '286 and TASM was my compiler of choice. You've probably already run into the problem with Action!: As your programs get bigger there isn't enough room to have them and your compiled code resident in memory at the same time so you compile from disk. Once you get to that stage with assembly it makes sense to go with good editor and cross compiler. That is the time when you will be forced to switch to something more sophisticated.

****As long as you are just writing a couple of lines of code to change the left margin or background colors you are fine.****

It's a tough call because you will eventually want to chose the environment that is most suited to your style. You've been on Linux for a while so you are used to multitasking and fault tolerant systems. I wonder if you can go back! :)

I like<used to> to have my code in a word processor/editor on the Intel side, Atari running either in emulation or connected via SIO2PC, then compile and test from there. Atari crashes, you still have your code safe in the Intel box. Sheesh! TASM would compile a 30k assembly files in 2 seconds. If I was doing that on an Atari with an ED/ASM cart I would still be waiting.

Rick

Last-modified: August 7, 2011

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT
Kept by Michael Current, michael@mcurrent.name

The latest version of this document is posted to these Usenet newsgroups
every 10 days: comp.sys.atari.8bit, comp.answers, news.answers

Greetings everyone!

Here is the lucky winner for December 2011 at The DarkForce! BBS:

December 2011
1. Dark Willow wins a free 12 issue/1 year subscription to
Atariuser Magazine.

Also, here is the January 2012 prize:

January 2012
1. Atariuser Magazine - some lucky caller will win a free 12 issue
/1 year subscription to Atariuser Magazine.

Congratulations to our winner, and good luck to this months callers!

:)

4954. Connecting 600xl and / or 800xl to lcd via vga?

Newsgroup: comp.sys.atari.8bit
Date: 2012-01-05 09:38:01 UTC
From: Matt Macari <matt@theverge.com>
Message-ID: <88373c54-dda8-4867-a056-2070f61ae68b@t8g2000yqg.googlegroups.com>
Source record: 493

Hello:

I'm a longtime Apple II collector and have picked up a 600xl and a 800xl. I would like to hook them up to one of my LCD displays. Is there any easy way to do that with available adapters if I have VGA on my LCD? Is it the same for the 600xl and the 800xl?

Sorry if this is basic stuff, but the Atari setup is still new to me.

Thanks,
Matt

Has your LCD display only VGA input?

Easy may cost a bit. The 800XL has both composite and RF channel 2-3
output. If your LCD only have VGA you will may have to buy a composite
to VGA converter.
http://www.walmart.com/ip/StarTech-Composite-S-Video-to-VGA-Video-Converter-for-Computer-M
onitors/14658986

The 600XL is just a bit tougher, IIRC it only has RF output. A cheap
way around this is to plug the RF<with proper switch box> into
something like an old VCR with composite outputs.

You still have to deal with sound. The audio output of the 800Xl can
go into just about any amplifier like a home stereo or TV that has the
inputs. Once again on an old VCR it should have RF to both video and
audio output.

In my mix of hardware I still have an old Commodore composite color
monitor, a 1702, that has a built in audio amplifier. When it came
time to get some LCD in the mix I chose a portable DVD player with
composite inputs. Price wasn't that much more then buying a composite
to VGA converter.

Sorry I replied with useful information. I just realized you are that
fruitcake who when confronted with documentation such as copyrights
said the information was falsified. When proved to be wrong resorted
to insults. You need professional help, there is something seriously
wrong with you.

Sincerely
Rick

Source record: 499

http://www.gamegavel.com/html/category/11705-1.html

I'm not the seller/don't know who it is/not my bag. I just thought it
was interesting to see the inside of the prototypes. I always thought
the 5200 cartridges were over sized/bloated but seeing the prototypes
filled with 2732 ROMs gives me a bit of insight. In retrospect Atari
had probably cornered the market on 4k ROMs and wanted completed games
to go with the introduction of the 5200 circa 1982.

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT

4967. Seattle Retro-Computing Society's 1st 2012 meeting: Sat. Jan. 28th

Newsgroup: comp.sys.atari.8bit
Date: 2012-01-25 03:54:55 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <97ad8ab2-b842-46b3-8ed6-2afe7f79e52b@n8g2000pbc.googlegroups.com>

Come one, come all, to the Seattle Retro-Computing Society's first
monthly meeting of 2012! It will be held Saturday, January 28th from
11:30 AM to 5:00 PM (please note our new, later starting time).

Do you do any of the following with old computers? Will you be near
Seattle on Saturday?

+ Use, collect, and/or restore them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," then the SRCS is for you! We exist so you
can
show off your awesome stuff, bounce ideas off of fellow enthusiasts,
and
be inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor
of vintage machine you prefer! Come on down and tell us about it!

The meetings are graciously hosted by the Living Computer Museum,
which
is gradually fitting out a computer museum in Seattle's SODO
neighborhood. There will be refreshments, a Buy-Sell-Free-Trade table,
and enough table space & power to set up anything you may want to show
off!

For further details, please see our web page at
http://www.seattleretrocomputing.com/ and our mailing list at
http://groups.google.com/group/seattle-retrocomp . Hope to see you
there!

Gordon "gsteemso" Steemson
SRCS agitator-in-chief

bangs head on wall

Yep. 'Tis who it be; just looked at credits of Super Tux 2.

Must shutdown brain and replace faulty memory module...oh wait: don't have a spare! CRAP!!!

4978. Announcement: cc65 version 2.13.3

Newsgroup: comp.sys.atari.8bit
Date: 2012-02-08 13:05:11 UTC
From: uz@spamtrap.musoftware.de
Message-ID: <jgtru7$p9d$1@mauli.musoftware.de>
Source record: 417
Cross-posted to: comp.sys.cbm,comp.sys.oric,comp.sys.atari.8bit,comp.sys.apple2.programmer

[Crossposted - please remove irrelevant newsgroups when replying]

I'm proud to announce version 2.13.3 of cc65. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- the following Commodore machines:

VIC20
C16/C116 and Plus/4
C64
C128
CBM 510 (aka P500)
the 600/700 family
newer PET machines (not 2001).

- the Apple][and successors.

- the Atari 8 bit machines.

- GEOS for the C64 and C128.

- the Nintendo Entertainment System (NES).

- the Supervision console.

- the Oric Atmos.

- the Lynx Console.

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This version is a bugfix release against 2.13.2. It includes about 40 bug and documentation fixes and some minor improvements:

* Fixed some macro issues (cc65).

* Static const local data goes into RODATA, not DATA (cc65).

* Fix error handling in .LEFT (ca65)

* Fixed problems with 80 column mode (C128 library).

* Fix problem when converting function to void pointer (cc65).

* Fix register info for several runtime functions. Result was invalid code (cc65).

* Fix smbx and rmbx instructions (da65).

* Fix problem with .REPEAT (ca65).

* Fix an error in the runtime division routine (cc65).

* Fix problem with alignments >= 256 bytes (ca65).

* The LINE function mistakenly enabled the BASIC ROM (TGI driver for C64).

* Fix internal error caused by error recovery (or lack of) (cc65).

* Fix invalid handling of signed int types in some cases (cc65).

* Fix some issues with conio scrolling (C128 library).

* Fix and improve the code for compares (cc65).

* Fix some macro issues (ca65).

* Fixed/improved several error messages (all tools).

* Disallow __asm__ on global level (cc65).

* Remove final jump to RESTOR for all CBM platforms (cc65 libraries).

* Add missing export for CBM510 platform (cbm510 library).

* Fix problem with access to structs returned by functions (cc65).

* Fix an internal error in the code generator (cc65).

* Merge back POSIX directory routines for the Atari (atari library).

* Merge back Olivers C interrupt handling code (cc65 libraries).

* Several documentation changes.

* Several documentation fixes and improvements.

Precompiled binaries are available for the most common platforms. On many other host platforms, the sources compile out of the box, so you'll able to create your own binaries.

For RedHat Enterprise Linux 5, ready made RPM packages are available. These packages may also work on other rpm-based Linux systems. Please note that there are separate RPMs for the compiler proper, the docs, and the target specific libraries. To develop code for one of the target machines, you need the compiler RPM package *and* one of the target machine packages. Be sure to download the documentation package if you're new to cc65.

For windows users, there's a user friendly installer package (the one with the .exe extension). All subpackages are selectable from within the installer dialogue. The installer will also setup the necessary environment variables and start menu entries. It is recommended that Windows users choose this

package instead of the .ZIP files.

Precompiled binaries for DOS, OS/2 and Windows are available in ZIP archives.
As with the RPM packages, you need the package for the development host system
(Windows or whatever) *and* one or more of the target machine packages, plus
optionally the doc package.

All packages are available from the MU software FTP server:

ftp://ftp.musoftware.de/pub/uz/cc65/

More information on cc65 can be found on the cc65 web page at

http://www.cc65.org/

There is also a mailing list for discussing cc65 related issues (programming,
suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

While I'm the main developer of cc65, it is actually a joint effort. I would
like to thank the target library developers, all the people on the cc65
mailing list, all those sending suggestions and feedback, and even those
bugging me for a new stable release:-) The CREDITS file is probably
incomplete, but you know who you are.

Thank you!

Uz

UPDATES SINCE PREVIOUS POSTING:
2012.01.29 Grandovec Bostjan: Pantheon 0.400
2012.01.15 added: KryoFlux Products & Services Limited
2012.01.11 FAIL (First Atari Image Library) 1.2.0 (2011-12-16)
2012.01.10 updated: Jonathan Halliday
2012.01.10 Marcin Lewandowski: Atari800Win PLus 4.1
2012.01.10 Pecus and Pirx: Scorched Earth for Atari XL/XE build 115,
(2009-08-25), Micro-SpartaDOS 4.5/4.6 (2010)
2012.01.10 added: Lotharek
2012.01.10 updated: Candle
2012.01.10 DLT: SpartaDOS X Version 4.45 (4 Nov. 2011)
```

2012.01.10 added: Whizzo Software
2012.01.03 Avery Lee: Altirra 2.00
2011.12.07 added: Grandovec Bostjan (Pantheon emulator)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry should contain a valid postal address or web page address.

Entries do not include an email address due to the overwhelming amount of spam that would result.

Internation Reply Coupons

The following is from: (2010.09.12)
http://www.upu.int/en/activities/international-reply-coupons/about-irc.html

About International Reply Coupons
When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country; however, if they are from different countries, the enclosed postage stamp will not be valid.

All member countries
This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. As the service began before the days of airmail, the earliest coupons could only be redeemed for a single-rate ordinary postage stamp to a foreign country. In terms of today's UPU Convention, International reply coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

Mandatory to exchange
The UPU's International Bureau processes several million coupons each year and deals with of all accounting aspects. The International Bureau does not sell IRCs directly to customers; they must buy them from their local post office. Although Posts are not obliged to sell IRCs, it is mandatory for Posts to exchange the coupons. If a Post does not sell IRCs, it is possible to purchase them in a post office located in a neighbouring country.

DISCLAIMER

Appearance in this list does not constitute a recommendation or endorsement of the business, individual, product, or service listed.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Posting-Frequency: 20 days
Last-modified: January 7, 2012

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from 1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit family of computers are owned by Atari Interactive, Inc., a subsidiary of Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT
Kept by Michael Current, michael@mcurrent.name

Congratulations! I'm eager to find time some day to play with this thing,
at last. In the meantime, just had our 2nd baby, so it may be years off
at this point. :^)

-bill!

4988. ANNOUNCEMENT: Spring-Time Retro-Computing Convention

Newsgroup: comp.sys.atari.8bit
Date: 2012-02-16 16:48:23 UTC
From: Payton Byrd <plbyrd@gmail.com>
Message-ID: <9065928.144.1329410903979.JavaMail.geo-discussion-forums@ynel5>
Source record: 427

What is it?

The Spring-Time Retro-Computing Convention is a family oriented event where people of all ages are encouraged to come learn about computers from the Golden Years of computing technology. The STRCC is not geared to a specific computer or manufacturer, but is intended to be inclusive of various brands and models such as the Commodore 64, Apple II and Atari 800. Even if you have or are a fan of something truly unique, you are invited to attend and help spread the public knowledge of your hobby.

Attending SRTCC is free. If you would like a table to set up your vintage hardware for display the fee is a mere $10 per day. If you want to attend SRTCC and sell your goods or services, each table used is $225 for all three days (Friday, Saturday, Sunday). The SRTCC is not operated for a profit so donations will be gladly accepted (Donations of $50 or more get a free non-vendor table for all three days). Any donations above the actual cost of the event will be put towards a local charity.

If you are interested in attending and need a table, please email me at srtcc@paytonbyrd.com to make arrangements.

The SRTCC is being held at the Riverview Inn in beautiful and historic Clarksville, TN. The address is 50 College Street, Clarksville, TN, USA 37040.

You can read more and announce your intention to go over on Facebook: http://www.facebook.com/events/104225689703035/

4989. Seattle Retro-Computing Society meets Sat. Feb. 25th

Newsgroup: comp.sys.atari.8bit
Date: 2012-02-23 06:03:08 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <1ee51307-9ff0-47b1-bf05-e72210489d65@i10g2000pbc.googlegroups.com>
Source record: 428
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.ti,comp.sys.m6809,comp.sys.m68k

Come one, come all, to the Seattle Retro-Computing Society's regular monthly meeting! It will be held Saturday, February 25th from 11:30 AM to 5:00 PM (please note our new, later starting time).

Do you do any of the following with old computers? Will you be near Seattle on Saturday?

+ Use, collect, and/or restore them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," then the SRCS is for you! We exist so you can
show off your awesome stuff, bounce ideas off of fellow enthusiasts, and
be inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor of vintage machine you prefer! Come on down and tell us about it!

The meetings are graciously hosted by the Living Computer Museum, which
is gradually fitting out a computer museum in Seattle's SODO neighborhood. There will be refreshments, a Buy-Sell-Free-Trade table, and enough table space & power to set up anything you may want to show off!

For further details, please see our web page at http://www.seattleretrocomputing.com/ and our mailing list at http://groups.google.com/group/seattle-retrocomp . Hope to see you there!

Gordon "gsteemso" Steemson
SRCS agitator-in-chief

It is a Limited Edition, made to get rid of the heavy and unregulated
original Atari 2600 AC/DC Adaptor. Also compatible with an unexpanded
Sinclair ZX-81 as they shares the same connector and the same polarity.

Link:
170789968141 (eBay)

Specifications:
. 9VDC @ 500mA
. OVP (Overvoltage Protection)
. Highly Filtered SMPS
. 110~220V Universal

Used for five hours in order to fully test its functionality.

Cheers,
Oge

Hello,

I am searching for the Bit-Writer supplement for the Super Archiver
which was sold by CSS in the past.
It does not matter if it is just the Hardware-Board or a complete 1050
Drive.

Best
Michael

Hello,

if the 1050 contains also the "Bit Writer" supplement I would like to
buy it.
The software for the super archiver and also for "bit writer" should
be included as well.

Whats the price for it?

Best
Michael

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

5010. Seattle Retro-Computing Soiciety meets Saturday, March 24th

Newsgroup: comp.sys.atari.8bit
Date: 2012-03-19 23:11:05 UTC
From: SRCS Admin <searetcompsoc@gmail.com>
Message-ID: <16860618.3817.1332198665351.JavaMail.geo-discussion-forums@pbcr5>
Source record: 449

Come one, come all, to the Seattle Retro-Computing Society's regular monthly meeting! It will be held Saturday, March 24th from 11:30 AM to 5:00 PM (please note our new starting time, which is an hour later than it was last year).

Please read the important announcement about our website at the end of this message!

Do you do any of the following with old computers? Will you be near Seattle on Saturday?

+ Use, collect, and/or restore them
+ Play games on them
+ Write programs for them
+ Develop new hardware for them
+ Help other people do any of the above

If your answer was "yes," then the SRCS is for you! We exist so you can show off your awesome stuff, bounce ideas off of fellow enthusiasts, and be inspired by one another's achievements, plans and aspirations.

No idea is too big or too small, and we're not picky about what flavor of vintage machine you prefer! Come on down and tell us about it!

The meetings are graciously hosted by the Living Computer Museum, which is gradually fitting out a computer museum in Seattle's SODO neighborhood. There will be refreshments, a Buy-Sell-Free-Trade table, and enough table space & power to set up anything you may want to show off!

For further details, please see our web page at http://www.seattleretrocomputing.com/ and our mailing list at http://groups.google.com/group/seattle-retrocomp . Hope to see you there!

We are pleased to announce that the feature on our website which says who is coming, what they mean to bring, and what they hope someone else will bring has been de-zombied. We formerly had trouble with it not resetting after the meetings each month, so no one could rely on anything they saw there unless it happened to contain a date.

Well, it now works properly (AND says when you're coming even if you don't say you'll bring anything!) -- but since everyone kind of gave up on it over the last few months, as I write this only three people have filled it out for the coming meeting. Please take a moment to fill in your RSVP for March!

Gordon "gsteemso" Steemson
SRCS agitator-in-chief

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/

ABOUT THIS DOCUMENT

5014. Power supply is out...

Newsgroup: comp.sys.atari.8bit
Date: 2012-03-27 05:34:15 UTC
From: "Ronald J. Hall" <darklord@suddenlink.net>
Message-ID: <4f715157$0$8479$bbae4d71@news.suddenlink.net>
Source record: 253

As far as I can tell, the power supply on the Mega ST4 that runs my BBS
is out.

I'll order a new one from Best Electronics, but the BBS will probably be
down for a few days...

Apologies!

Many years ago, when the Mega ST4 was my primary computer, I had power supply problems.

A close examination of solder joints in the power supply revealed a number of joints literally had developed cracks in the solder. Removed the old solder, resoldered, and never had another problem.

Might be something to look into.

You're welcome.

I forgot to mention, I had to use a magnifying glass to find some of the cracks.

Greetings everyone!

Here is the lucky winner for March 2012 at The DarkForce! BBS:

March 2012
1. Dal wins a free 12 issue/1 year subscription to
Atariuser Magazine

Also, here is the April 2012 prize:

April 2012
1. Atariuser Magazine - some lucky caller will win a free 12 issue
/1 year subscription to Atariuser Magazine.

Congratulations to our winner, and good luck to this months callers!

:)

Here is the list of what he sent to me, might have some of this still..

Atari 8-bit Equipment

800 in original box w/power supply. Powers up.

800 no box w/power supply. Powers up.

850 in original factory shipping box bad power supply. Powers up.

850 no box, no power supply. Powers up.

810 in original box w power supply. Powers up.

810 in original box, no power supply. Powers up.

810 needs repair

Spare MPI drive mech, condition unknown (new in original shipper)

810 chassis w/power supply board only

3 spare drive mechs, parts only

400/800 port diagnostic board

850 diagnostic turnaround module

400/800 Factory service manual

Misc bags of original factory part and ICs

Misc interconnect cords

Copy of ï¿½The Chipï¿½ installation manual

Boxes range from good to poor condition. Units power up only, no guarantee of functionality. Drives likely need slide rail lubrication and alignment.

5029. Atari BASIC: A Self-Teaching Guide (XL Edition)

Newsgroup: comp.sys.atari.8bit
Date: 2012-04-09 07:54:48 UTC
From: bill@newbreedsoftware.com
Message-ID: <4f8295c8$0$16145$742ec2ed@news.sonic.net>
Source record: 268

"Atari BASIC: A Self-Teaching Guide (XL Edition)" was, along with the Atari BASIC reference manual (which I distinctly remember reading some of while I was going somewhere in the car with my mom, and laughed about the fact that there was a "POP" command :)), was what I used to cut my childhood programming teeth.

Today I spent an hour or so, whizzing through the first couple of chapters, having my 5yo son type in some BASIC. :) Good times.

He eventually got distracted by his infant brother (and possibly a bit excited from eating a bit more Easter candy), and wandered off to play with another geeky thing he's technically too young for: an electronics kit :)

I am now hankering to do more TurboBASIC XL programming. *nostalgia* :)

Old-timer here who hasn't been on this group to speak of in 10-12 years or so. And can't promise to really renew my participation at this time, either. I've been out of the loop a long time. I still have my Atari system(s) but they haven't been set back up since I had to pack them away to move five years ago. All my 1200 floppies, too, are a thousand miles away at a friend's house who's supposedly going to image them all with some newfangled hi-falutin' hardware gadget, so's I can use them with one or another of the various emulators.

So Uz, how and when did you and your team become the main developer(s) of CC65? Is this the SAME CC65 that John Dunning originated back in the late 90s? I thought he gave all his project floppies to ME. Not that I've ever been able to READ them... Or did you guys start a whole separate project and just happen to give it the same NAME? I'm curious.

Chris Chiesa

While I'm not Uz, you certainly find a good overview of CC65 here:

http://www.cc65.org/index.php#Overview

Yes, it is indeed based on John Dunning's sources, as far as I read this.

Greetings,
Thomas

I didn't get any floppies, and I had no contact to John R. Dunning. I just downloaded the sources from

http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/

That must have been around 1996 or so. Since then, most stuff has been rewritten from scratch. The assembler, linker, archiver and all other tools are complete rewrites. Same for the library. The only piece that does still contain some old code is the compiler itself. The whole package is cross platform now, both on the host and on the target side.

The cc65 web site

http://www.cc65.org/

has more information. There's also a - somewhat outdated - text file that comes with the documentation and describes the differences:

http://www.cc65.org/doc/newvers.txt

Do you have an email address of John? I never managed to get any hint on how to contact him.

Regards

Uz

Welcome to the comp.sys.atari.8bit newsgroup!

Discussion about 8 bit Atari micros.

Welcome to the Usenet newsgroup for discussion about the Atari 8-bit family
of computers! These include the Atari 400, 800, 1200XL, 600XL, 800XL, 65XE,
130XE, and 800XE personal/home computers, and the Atari XE video game system.

The 400/800/1200XL/600XL/800XL computers were produced from 1979-1984 by
Atari, Inc., of Sunnyvale, California, USA, while Atari was a division of
Warner Communications.

The 800XL/65XE/130XE/800XE computers and XE game system were produced from
1984-1992 by Atari Corp., also based in Sunnyvale, California, USA.

Today, remaining intellectual property rights associated with the Atari 8-bit
family of computers are owned by Atari Interactive, Inc., a subsidiary of
Atari, SA of Lyon, France. http://corporate.atari.com/
